PREFACE

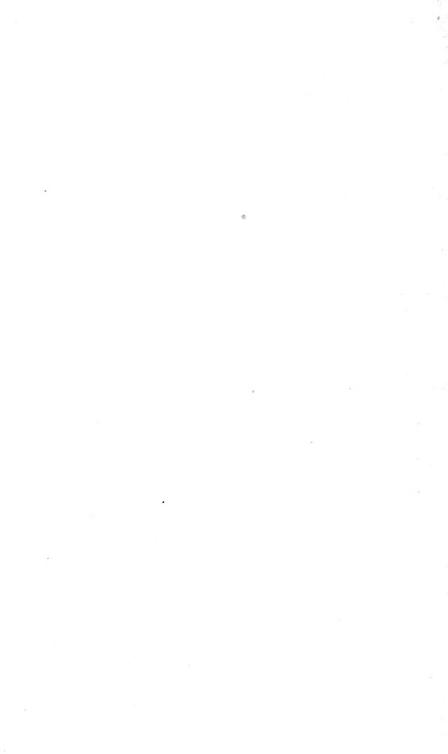

The present volume continues the systematic account of the flowering plants of Jamaica* on the same lines as Volume III. There has been some delay in publication owing to conditions prevailing during the last five years. The fact that printing was begun in 1917 will explain the absence of reference, especially in the earlier sheets, to papers which may have appeared subsequently.

We are again indebted for the loan of specimens to the Government of Jamaica, and to various institutions and individuals previously mentioned, especially to the Directors of the Royal Botanic Gardens, Kew and Edinburgh, the Bristol Museum, and the Naturhistoriska Riks-Museum at Stockholm.

A. B. RENDLE.

CORRECTIONS AND ADDITIONS

Page 44, lines 1 and 4 of Key, for Leaves read Leaflets.

- ,, 77, line 4, before Browne read Sloane Herb. v. 91, 92!
- ,, 85, ,, 3, for 361 read 360, and for 361 (occurring later) read 363.
- ,, 168, ,, 4, for opposite read alternate.
- ., 230, ., 6, after 1791 add (in part), and for L. read Jacq.
- ,, 239, ,, 5 from bottom, for Triapteris read Triopteris.
- ,, 245, ,, 5 of description of fig., for L. read Jacq.
- .. 247, , 6, and line 4 from bottom, for L. read Jacq.
- ,, 303, ,, 7 from bottom, after arborea &c. read Sloane.
- ,, 307, ,, 2, add Oil Nut.

For the convenience of workers a comparative scale showing centimeters and inches is given below.

CONSPECTUS OF THE FAMILIES CONTAINED IN THIS VOLUME

DICOTYLEDONS

Stems with open bundles. Leaves net-veined. Floral parts generally in fours or fives, sometimes in threes. Embryo with two cotyledons.

Families *LEGUMINOSÆ* To *EUPHORBIACEÆ* (Calyx free from the ovary. Petals distinct)

- Fam. 39. Leguminosæ. Fls. irregular, generally 2-sexual, or regular generally polygamous. Sepals more or less united; generally 5, imbricate in the irregular flowers, the fifth lowest; 5 or 4, valvate in the regular flowers. Petals as many as the sepals; in the irregular flowers the fifth highest—outside in Papiliouatæ, inmost in Cæsalpinieæ. Carpel one. Trees, shrubs, or herbs. Leaves alternate, usually compound, generally stipulate. Fruit a pod, sometimes splitting into 1-seeded joints, sometimes not splitting open, rarely drupe-like. Endosperm wanting or scanty.
- Fam. 40. Geraniaceæ (Geranium). Fls. 2-sexual, regular. Sepals and petals distinct, imbricate. Stamens 10. Carpels 5, united with the axis, produced above into a beak. Herbs. Leaves simple, palmately lobed, opposite, stipulate. Fruit a capsule separating elastically into 5 1-seeded parts.
- Fam. 41. Oxalidaceæ (Oxalis). Fls. 2-sexual, regular. Sepals 5, imbricate. Petals 5, twisted in bud. Stamens 10. Ovary 5-celled; styles 5. Herb. Leaves digitately 3-foliolate, alternate, stipulate. Fruit 5-celled, a capsule.
- Fam. 42. Linaceæ (Linum). Fls. 2-sexual, regular. Sepals and petals 5, imbricate; petals generally twisted in bud, fugacious. Stamens 5. Ovary 5-celled. Perennial herb. Leaves simple, alternate. Fruit a capsule, 5-celled.
- Fam. 43. Erythroxylaceæ (Erythroxylon). Fls. 2-sexual, regular. Calyx persistent; segments 5, imbficate. Petals 5. Stamens 10, united below into a cup. Ovary 3-celled, with 2 cells undeveloped. Shrubs or trees. Leaves simple, alternate; stipule one, within the petiole. Fruit a drupe with one seed.

- Fam. 44. Zygophyllaceæ. Fls. hermaphrodite, regular. Sepals and petals usually 5, imbricate. Stamens 10. Ovary 2–12-celled; styles united. Herbs, shrubs, or trees. Leaves abruptly pinnate. opposite, stipulate. Fruit composed of 2 to 12 cocci.
- Fam. 45. Rutaceæ. Fls. hermaphrodite, polygamous, or diocious, regular (but corolla oblique in Ravenia), parts usually in fours or fives. Sepals and petals usually imbricate. Stamens as many as, or twice as many as, the petals, or numerous. Disk between stamens and ovary. Carpels 4 or 5 (8 in Peltostigma), united into a single 4-5-celled ovary, or free at the base and united in styles or stigmas, or altogether free and 1-celled. Shrubs or trees, usually gland-dotted and strongly smelling. Leaves usually compound and alternate, without stipules.
- Fam. 46. Simarubaeeæ. Fls. small, unisexual or polygamous, regular. Calyx 3-5-lobed. Petals 3-5, usually imbricate. Stamens at the base of a disk, as many as, or twice as many as, the petals. Ovary 2-5-lobed, 1-5-celled, or 3-5 free carpels; Styles 2-5. Shrubs or trees: Leaves simple or compound, alternate, without stipules.
- Fam. 47. Burseraceæ. Fls. 2-sexual, or polygamous, regular. Calyx 3-6-lobed. Petals 3-6, valvate, deciduous. Disk generally ring-like. Stamens twice as many as the petals. Ovary 2-5-celled; styles very short. Trees or shrubs. Leaves simple or pinnate with an odd leaflet, alternate, without stipules. Fruit drupaceous.
- Fam. 48. Meliaceæ. Fls. 2-sexual, regular. Calyx 4-5-lobed, imbricate. Petals 4-5, imbricate, convolute, or valvate. Disk various. Filaments united more or less into a tube, or adherent to the columnar disk (Cedrela). Ovary 2-5-celled. Trees or shrubs. Leaves compound, alternate, without stipules. Fruit a capsule or drupe.
- Fam. 49. Malpighiaceæ. Fls. 2-sexual, regular. Calyx 5--cleft, each of 4 lobes usually with 2 glands outside. Petals 5, clawed. Stamens 10. Carpels 3, more or less united into a 3-celled ovary, or separate; styles free (except Bunchosia). Trees or shrubs. Leaves simple, opposite, with or without stipules. Fruit a drupe or a capsule.
- Fam. 50. Polygalaceæ. Fls. 2-sexual, irregular. Sepals 5, imbricate, the 2 inner lateral larger, coloured, wing-like. Petals 3, united into a corolla: or 5 (2 reduced to scales). Stamens 8, united into a sheath. Ovary 1-2-celled. Herbs or shrubs. Leaves simple, usually alternate, without stipules. Fruit a capsule, winged in Securidaca.

Fam. 51. Euphorbiaceæ. Fls. unisexual, monæcious or dioccious, regular or slightly irregular. Perianth often small, sometimes wanting, sometimes dissimilar in the male and female flowers, either a calyx only or calyx and corolla. Stamens 1 to indefinite. Ovary usually 3-celled. Trees, shrubs, or herbs, often with milky sap. Leaves simple, sometimes lobed, rarely with 3 or more digitate leaflets, or reduced to scales. Fruit usually capsular, splitting into 1- or 2-seeded segments, sometimes not splitting open, with outside fleshy.

Fam. Callitrichaceæ. Fls. unisexual, without periauth. Male flower, a single stamen; female, a 4-celled ovary with 2 styles. Small aquatic or terrestrial plants, with simple opposite leaves.

KEY TO FAMILIES

[The figures refer to the number of the Family.]

A. Perianth wanting, or of a single series, the calyx.

Flowers 2-sexual	39.	$Crudia,\ Prioria$
Flowers 1-sexual. Ovary usually 3-celled Ovary 4-celled	51.	Euphorbiaceæ, Callitrichaceæ.
B. Perianth of a double series—sepals an	d pe	tals.
Flowers unisexual.		
Leaves simple.		
Ovary of four carpels cohering only at the apex		
Ovary 2–3-celled	51.	Euphorbiace \boldsymbol{x} .
Leaves pinnate.		77 (1 1
Styles sublateral	45.	Zanthoxylum.

NOTE ON

DR. PATRICK BROWNE'S Natural History of Jamaica.

Dr. Patrick Browne published his "Natural History of Jamaica" in 1756, three years after the appearance of Linnæus's "Species Plantarum." Browne did not adopt the binomial system of Linnæus, but quoted as synonyms of his own diagnostic names the diagnoses of the "Species Plantarum." In his own copy of the History, now in the library of the Linnean Society, Linnæus added the binomial as a marginal note.

Linnæus acquired Browne's herbarium in 1758, and has underlined in his copy of the "History" the first letter of those species of which there was a specimen in Browne's herbarium. In some instances these specimens were the foundation of species published by Linnæus in the "Systema," edit. 10, 1759, for instance, Cassia viminea; others represented species which Browne had failed to identify with those in the "Species Plantarum," for instance, C. biflora. Sometimes a specimen in Browne's herbarium has not been identified by Linnæus with any diagnosis of Browne, but has been published in the "Systema," for instance, C. pilosa.

DICOTYLEDONS

FAMILY XXXIX. LEGUMINOSÆ.

TREES, shrubs, or herbs. Leaves alternate or rarely opposite, nearly always compound, sometimes simple, generally with stipules. Peduncles axillary or terminal, with one to numerous flowers. Flowers: irregular generally hermaphrodite, or regular generally polygamous. Sepals more or less united, generally 5 in the irregular flowers, the fifth lowest; 5 or 4 in the regular flowers. Petals as many as the sepals; in the irregular flowers the fifth highest. Stamens generally twice as many as the petals, sometimes as many, sometimes indefinite, few or numerous, usually inserted on the margin of the receptacle. Carpel solitary, 1-celled; ovules numerous, attached at the interior angle. Fruit a pod, sometimes splitting into one-seeded joints. Endosperm scanty or wanting. Cotyledons generally flat, foliaceous or thick and fleshy; radicle superior.

Species over 12,000 in number, found in every part of the

world.

Subfamily 1. PAPILIONATA.

Flowers papilionaceous. Petals imbricate, the uppermost outside. Stamens 9 or 10, united into a sheath, or distinct in §§ 11, 12—numerous in § 12. Leaves simple, digitate or pinnate,

KEY TO SECTIONS.

Leaves simple, or digitate with 1, 3, or 5 leaflets.		
Flowers racemose or solitary	§ 1.	
Flowers in heads. Pod enclosed in the withered		
calyx and corolla	§ 2.	
Flowers covered by large bracts	§ 9.	Flemingia.
Leaves digitate with 2 or 4 leaflets	§ 4.	Zornia.
Leaves reduced to spines	§ 1.	Ulex.
757		12

Leaves pinnate with an odd leaflet.
Leaves with 1-3 leaflets.
Pod jointed $\S 4$.
Pod not jointed.
Leaflets with conspicuous stipels § 8.
Leaflets generally without stipels.
Stamens numerous, all distinct. Petal 1 § 12.
Stamens 10 (or 9), only one sometimes distinct.
Leaflets with glandular dots beneath § 9.
Leaflets without glandular dots.
Trees or shrubs \$ 10. Dalbergia. Herbs woody below \$ 3. Indigofera.
Herbs woody below § 3. Indigofera.
Leaves with 5 to several leaflets.
Pod jointed § 4. Æschynomene.
Pod not jointed.
Stamens 10, all distinct. Shrubs or trees § 11.
Stamens 10 or 9, one only sometimes distinct.
Stems twining § 8. Clitoria.
Stems not twining.
Herbs or shrubs. Stamens 9 in one bundle,
one usually distinct § 3.
Trees or shrubs, branches sometimes
twining. Stamens in 1 or 2 bundles,
one sometimes more or less distinct § 10.
Leaves abruptly pinnate.
Leaves with 2 pairs of leaflets. Pod burying itself
in the earth§ 5.
Leaves with several pairs of leaflets.
Leaves with a tendril § 6.
Leaves without tendrils.
Branches twining \$7. Branches not twining \$3. Sesbania.
Branches not twining § 3. Sesbania.
TITLE OF A CONTROL
KEY TO GENERA.
2.1 II 1 1 - 1 - (+ + + + +
§ 1. Herbs or shrubs (not twining). Leaves simple or
digitate, with 3 or 5 leaflets, or reduced to spines.
Flowers various. Pod 2-valved, inflated in Crota-
laria.
Leaves simple, or digitate with 3 or 5 leaflets 1. Crotalaria.
[Leaves reduced to spines Ulex.]
§ 2. Herbs. Leaves digitately 3-foliolate, leaflets denti-
culate. Flowers in heads. Pod small, enclosed
in the withered calyx and corolla, not opening 2. Trifolium.
•
§ 3. Herbs (woody below) or shrubs, not twining, some-
times arborescent (in Sesbania). Leaves impari-
pinnate (usually 5 or more leaflets) or abruptly
pinnate (in Sesbania). Flowers in racemes, axil-
Tary, terminal, or opposite the leaves. Pod 2-valved,
or sometimes scarcely opening (in Sesbania).
Racemes axillary.
Leaves imparipinnate
Leaves abruptly pinnate
the leaves
Tracemes appearing berore increases

	§ 4. Herbs, sometimes shrubby below, not climbing, or small trees. Leaves imparipinnate, leaflets 1-3, or numerous (in <i>Eschynomene</i>), or digitately 2-4- foliolate. Pod jointed; joints 1-seeded, usually separating.		
	Leaves with numerous leaflets	7.	Eschynomene.
	Leaves 1-3-foliolate with scarcely any common petiole; stipules spinescent. Small trees	6.	Brya.
	Leaves 3-foliolate; leaflets without stipels. Stipules united to the leaf-stalk	Q	Stylosanthes.
	Leaves digitate with 2 or 4 leaflets		Zornia.
	Leaves 3-foliolate; leaflets with stipels		
	[Leaves with 1 large leaflet; petiole winged	10.	D. triquetrum.]
	[Leaves with one 2-lobed leaflet		Lourea.]
	[Leaves with 1 leaflet; calyx dry, stiff		Alysicarpus.
	[§ 5. Low-growing herbs. Leaves abruptly pinnate.		Joven Pust
	Flowers 1 or more, crowded in the lower axils. Pod burying itself in the earth		Arachis.
	[§ 6. Climbing herbs. Leaves abruptly pinnate ending		-
	in a tendril; leaflets without stipels. Stipules semisagittate. Flowers 1 or 2 together in the		
	axils. Pod 2-valved		Vicia.]
	§ 7. Shrubs with twining branches. Leaves abruptly pinnate, with the end of the petiole produced and bristle-like; leaflets without stipels. Flowers in clusters along axillary and terminal racemes. Pod	11	47
	2-valved	11.	Aorus.
*	§ 8. Herbs or shrubs, twining (rarely erect, or prostrate, or trees). Leaves pinnately 3-(5-7-)foliate; leaflets with stipels. Flowers in axillary racemes, usually 2 or more in clusters along the rhachis, the racemes sometimes reduced to one flower or a few clustered in the axils. Pod 2-valved.		
	Trees. Flowers red.,	15.	Erythrina.
	Herbs or shrubs.		
	Standard much larger than the other petals and flat.		
	Bracteoles longer than the calyx or nearly		
	as long	12.	Centrosema.
	Bracteoles less than half as long as the calyx	19	Clitonia
	Standard shorter than the other petals		
	Standard not much larger nor smaller than the other petals.	10.	mucuna.
	Keel forming a complete spiral	20.	Phascolus.
	Keel not forming a complete spiral.		
	Style hairy along the inner side above.	Q1	Viana
	Stigma oblique or lateral [Stigma subglobose on inner side of	21.	vigna.
	style. Root tuberous		Pachyrrhizus.]
	[Stigma small, terminal. Pod rough with warty projections along the		
	margins		Dolichos.]

Style without hairs.		
Calyx with 4 entire lobes.		6. 1
Pod narrow, linear	17.	Galactia.
Pod broad; margins thickened, upper furrowed	18.	Dioclea.
Calyx with 5 lobes, or 4 with one 2-toothed		
Calyx 2-lipped, upper large	19.	Can avalia.
§ 9. Herbs or shrubs, erect or twining. Leaves pinnately 3-foliolate or digitately 1-3-foliolate; leaflets with glandular dots beneath, usually without stipels. Flowers in racemes. Pod 2-valved. Erect undershrubs or shrubs. [Pod marked with oblique depressed lines, 5-seeded	22.	Cajanus.] Flemingia.] Rhynchosia.
Leaves imparipinnate with several leaflets, sometimes only 3 or 1; leaflets without stipels (except rarely in Lonchocarpus and Andira). Flowers in axillary panicles or racemes, panicles terminal or subterminal in Andira. Pod not opening, membranous, leathery, woody, or drupaceous. Leaflets alternate (or solitary).	09	Dalhausia
Leaflets 1 or 2–5. Pod with style terminal		
Leaflets 5-9. Pod with style lateral	24.	Pierocarpus.
Leaflets opposite. Flowers in axillary racemes. Pod flat, without wings Flowers in axillary panicles, appearing before	25.	Lonchocarpus.
the leaves. Pod with 4 wings	26.	Piscidia.
Flowers in terminal panicles. Pod drupaceous	27.	Andira.
§ 11. Shrubs or trees. Leaves imparipinnate; leaflets in 4-12 pairs, opposite or nearly opposite. Pod 2-valved or not splitting open.		
Shrub. Leaflets in 5-12 pairs. Pod constricted between the seeds, not opening, 5-9-seeded	28.	Sophora.
Tree. Leaflets in 4–5 pairs. Pod 2-valved, 1–2-seeded	29	Ormosia.
§ 12. Trees. Leaves reduced to 1 leaflet. Calyx closed before flowering, afterwards bursting into 2-4		J. 11000W.
irregular segments. Petals one—the standard	30.	Swartzia.

SUBFAMILY 2. CÆSALPINIEÆ.

Flowers irregular. Calyx imbricate (but subvalvate in *Poinciana* and *Parkinsonia*, spathaceous in *Bauhinia*). Petals imbricate, the uppermost inmost. Stamens usually distinct. Leaves pinnate or bipinnate, or composed of 2 leaflets united into a single 2-lobed leaf in *Bauhinia*.

_
§ 13. Leaves abruptly bipinnate (with an odd pinna in Cusalpinia coriaria), or most leaves simply pinnate in Humatoxylum. Calyx 5-cleft. Anthers versatile. Calyx-segments very imbricate. Tree. One segment of calyx larger, comb-like. Pod not opening, flat-compressed, thinning to the margin, as it were 2-winged
§ 14. Leaves abruptly pinnate. Calyx 5-cleft, segments
imbricate. Petals 5. Anthers basifixed, opening by pores or chinks. Seeds with endosperm 33. Cassia.
§ 15. Leaves composed of two leaflets united. Calyx spathaceous, 5-toothed. Petals 5. Anthers versatile. Seeds with endosperm
§ 16. Leaves abruptly pinnate or imparipinnate (in Crudia); leaflets 2 to numerous. Sepals 4, imbricate. Petals 3, 5, or none. Anthers versatile. [Leaflets numerous. Petals 3. Stamens 3, united into a sheath
§ 17. Leaves abruptly pinnate; leaflets in 1 or 2 pairs. Sepals 5, very imbricate. Petals none. Anthers versatile. Ovules 2
Subfamily 3. MIMOSEÆ.
Flowers regular, small. Calyx valvate. Petals valvate, generally united below the middle. Stamens distinct or united. Leaves bipinnate (pinnate in <i>Inga</i>).

anthers with a small gland, which drops off soon		
after the opening of the flower. Pollen granules numerous, distinct.		
Climbing shrub with tendrils. Pods very large	38.	Entada.
Trees or shrubs not climbing.		
Flowers in globular heads	39.	Piptadenia.
[Flowers in racemes		Adenanthera.]
[Flowers in spikes		Prosopis.
Herbs prostrate or floating		Neptunia.

§ 19. Parts of the flower in 5's or 4's. Flowers in		
globular heads. Stamens as many as, or twice as		
many as, the petals; anthers without glands.		
Pollen granules numerous, distinct.		
Parts of the flower in 5's. Calyx campanulate.		
Gland between the lowest pair of pinnæ	41.	Desmanthus.
Gland in middle of petiole, or just below the		
pinnæ, or wanting	43.	Leucæna.
Parts of the flower in 4's. Calyx minute	42.	Mimosa.
§ 20. Parts of the flower in 5's or 4's. Flowers in		
globular heads, or in spikes (in A. suma). Stamens		
indefinite, generally numerous, distinct or slightly		
united at the base. Pollen granules in 2-6 masses		
in each cell	44.	Acacia.
§ 21. Parts of the flowers in 5's. Stamens indefinite,		
sometimes few, united at the base or into a tube.		
Anthers small. Pollen granules in 2-6 masses in		
each cell.		
Leaves bipinnate.		
Pod strap-shaped, straight or slightly curved;		
valves elastically revolute from the apex	45.	Calliandra.
Pod broadly oblong, straight, thin, continuous	10.	O de terraine de la constante
within, valves not opening elastically nor		
twisted	46.	Albizzia.
Pod curved and twisted spirally, continuous		
within, splitting open	47.	Pithecellobium.
Pod straight or curved, continuous within,		
tardily opening	48.	Zuaia.
Pod curved or straight, thick, not opening,		00
with partitions between the seeds	49.	Enterolobium.

Subfamily 1. PAPILIONATÆ.

Flowers papilionaceous (that is, like a pea-flower). Sepals normally 5, united into a tubular or campanulate calyx. Petals 5, imbricate: the upper—the "standard," exterior; the 2 lateral—the "wings"; the 2 lower interior and generally parallel and united—the "keel." Stamens generally 10 (numerous in Swartzia); filaments united into a sheath enclosing the pistil, the uppermost often more or less free or sometimes wanting (all distinct in §§ 11 and 12); anthers all alike, or sometimes the alternate different. Radicle inflexed, accumbent on the cotyledons. Leaves digitately or pinnately compound, or sometimes simple.

§ 1. Herbs or shrubs (not twining). Leaves simple or digitately 3-5-foliolate, or reduced to spines. Flowers in racemes terminal or opposite the leaves, or solitary or shortly racemose in the axils. Stamens 10, all united into a sheath. Anthers alternately small, versatile, and long, basifixed. Pod 2-valved, inflated in *Crotalaria*.

1. CROTALARIA L.

Herbs or shrubs. Leaves simple or digitately 3-5-foliolate. Flowers yellow, but blue in C. verrucosa, in racemes terminal or opposite the leaves, axillary in C. lotifolia. Standard roundish: keel beaked. Staminal sheath split above. Rattle-wort.

Species about 450, widely dispersed through the warmer regions of the whole world.

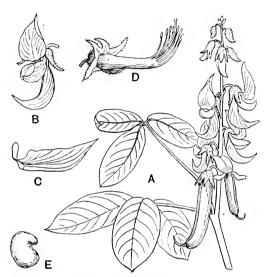

Fig. 1.—Crotalaria striata DC.

§ 1. Leaves simple.

*Stipules when present, not decurrent.

1. C. verrucosa L. Sp. Pl. 715 (1753); leaves ovate or roundish-elliptical; stipules foliaceous; flowers blue; pods pubescent with adpressed down. Bot. Mag. t. 3034; Macf. Jam. i. 238; Griseb. Fl. Br. W. Ind. 178; Bak. in Hook. f. Fl. Br. Ind. ii. 77. Type in Herb. Hermann in Herb. Mus. Brit.

Fls. throughout the year; common, Macfadyen! Liguanea, McNab! Lane! J.P. 962, Morris! Miss Foster! near Kingston, 500 ft., Clute! also Rothrock; Billy Dun, 500 ft., Campbell! Long Mt. road, Favcett! Watson's Hill, Manchester, 800 ft.; near Troy, 2000 ft.; Harris! Fl. Jam. 5833, 6381, S814. Port Royal, Lucea, Hitchcock.—Tropics.

Hill, Manchester, 800 ft.; near Troy, 2000 ft.; Harris! Fl. Jam. 5833, 6381, 8814. Port Royal, Lucea, Hitchcock.—Tropics.

Annual, scarcely shrubby, 2-3 ft. high, puberulous, glabrescent, branches and peduncles 4-3-angled. Leaves 7-3 cm. 1, 5-2 cm. br.; stipules lunate, deflexed. Racemes many-flowered. Calyx 2-lipped, half as long as the corolla, 7-10 mm. 1., glabrescent; segments narrowly triangular, acuminate. Pod oblong, 3-3.5 cm. 1., brown.

This species and others have been used as green dressings.

[C. juncea L. Sp. Pl. 714 (1753); leaves linear or oblonglinear, 4-10 cm. l.; stipules minute, setaceous, or wanting; pods pubescent-tomentose.—Bot. Mag. t. 490; Bak. tom. cit. 79; Griseb. op. cit. 179; Wils. in Reports Geolog. Jam. 276; Watt Dict. Econ. Prod. Ind. ii. 595. Type in Herb. Linn.

Fls. in autumn; Barbican, Liguanea Plain, McNab! Wilson; March! near Camp, 280 ft., Campbell! King's House grounds; Halfway Tree; Harris! Fl. Jam. 6111, 6905, 8274, 11,856; Constant Spring, Hitchcock.—Tropics of the Old World.

Annual, shrubby, to 10 ft. high, branching, silky-puberulous. Leaves silky-pubescent chiefly beneath, about 5 cm. br. Racemes long, with many flowers. Calyx 5-partite, nearly as long as the corolla, about 1.5 cm. l., segments lancoolate-linear. Pod oblong, about 3 cm. l.

The plant yields the Sunn or San hemp of commerce, and is cultivated for this purpose in the tropics of the Old World. It is used in the manufacture of ropes, fishing nets, saddles for pack horses, hose pipes, etc. It has considerable tensile strength, and, like European hemp, its tendency to rot under water seems to be very slight.

[C. tetragona Roxb. Fl. Ind. iii. 263 (1832); leaves long, lanceolate-linear, acuminate, 1–3 dm. l.; stipules minute, setaceous, or wanting; pods tomentose-pubescent.—Griseb. op. cit. 179; Wils. loc. cit.; Bak. tom. cit. 78.

Wilson; St. Andrews, Prior; Gordon Town, Roberts! Silver Hill,

Harris! Fl. Jam. 5597.—India to Java.

Shrub, to 6 ft. high, branches acutely tetragonal, when young pubescent. Leaves strigose-pubescent on both sides or glabrescent. Racemes laxly 6-10-flowered, 1-5 dm. l. or more. Bracts minute, linear. Flowers lemon-yellow. Calyx 2-lipped, segments very long, linear-lanceolate, densely brown-velvety, 2 cm. l. or more. Corolla somewhat longer than the calyx. Pod oblong, dark brown, 3·5-5 cm. l.]

[C. fulva Roxb. Fl. Ind. iii. 266 (1832); leaves oblong-lanceolate to oblanceolate (rarely elliptical), 6-8.5 cm. l.; stipules wanting, or minute, setaceous; flowers paniculate; pods thinly silky, enclosed within the calyx.—Grisch. op. cit. 179; Wils. loc. cit.; Bak. tom. cit. 80.

Bancroft! St. Mary, McNab! Wilson! Shortwood, 500 ft., Campbell! Hope Mines, 800 ft.; Hope River course, 600-700 ft.; Harris! Fl. Jam. 6243, 6825, 6943, 9037.—E. Indies to Sumatra, naturalized in Seychelles and Mauritius.

Shrub 3-8 ft. high; branches cylindrical, densely clothed with short brown silky hairs. Leaves closely silky, 2-3 cm. br. Racemes compound, in a terminal panicle. Bracts and bracteoles elliptical, cuspidate. Flowers fragrant. Calyx 5-partite, sericeous on the outside, 1-1·3 cm. l.; segments ovate, blunt. Pod globose-ellipsoidal, 2-seeded.]

2. C. retusa L. Sp. Pl. 715 (1753); leaves oblanceolate to oblanceolate-oblong, apex retuse or rounded; stipules very small, awl-shaped or wanting; bracts awl-shaped; pods glabrous.—Bot. Mag. t. 2561; Macf. Jam. i. 239; Griseb. op. cit. 179; Wils. loc. cit.; Bak. tom. cit. 75; Urb. Symb. Ant. iv. 281. Type in Herb. Mus. Brit.

Fls. in autumn; common: Macfadyen; Distin! St. Mary, McNab! Wilson! J.P. 615, 963, Morris! King's House grounds, Campbell! Buff Bay; Annotto Bay; Thompson! Hope grounds, Harris! St. George, Watt! Miss Foster! Gordon Town, Ball! Kingston, Clute! also Hitchcock; Port Antonio, Millspaugh. Fl. Jam. 5709, 6474, 6784, 7918, 8487.—Tropical and subtropical regions.

Annual, shrubby, 1-3 ft. high, silky-puberulous or glabrate. Leaves glabrous on upper surface, tomentellous beneath, pellucid-dotted, 3-8 cm. l. (and more), 1-2·5 (3·5) cm. br. Racemes many-flowered, long. Flowers showy. Calyx 2-lipped, about half as long as the corolla, 1-1·5 cm. l., sparingly puberulous; segments triangular-lanceolate. Standard with purple lines inside, somewhat brownish outside, to 2 cm. l. Pod oblong. blackish, 3-4 cm. l.

[C. sericea Retz. Obs. v. 26 (1789) (non Burm. f.); leaves oblanceolate-oblong, mucronulate; stipules semi-sagittate, sessile, reflexed, persistent; bracts ovate, foliaceous, persistent; pod

glabrous.—Griseb. loc. cit.; Wils. loc. cit.; Bak. loc. cit. C. Retzii Hitchc. in Rep. Miss. Bot. Gard. iv. 74 (1893).

Negro River, Purdie! Wilson! Waters! Lucea, Hitchcock.-India, Pegu, Malacca.

Shrubby, 2-3 ft. high, glabrate. Leaves pubescent with adpressed hairs beneath, 7-15 cm. l., 2·5-4 cm. br. Racemes long, many-flowered. Cally 2-lipped, shorter than the corolla, 1·5 cm. l., glabrous; segments triangular, acuminate. Pod oblong, 3-5 cm. 1.]
C. sericea Burm. f. Fl. Ind. 156 (1768) is a different species and has been

doubtfully referred to C. assamica Benth.

[C. nana Burm. f. Fl. Ind. 156, t. 48, f. 2 (1768); annual, 1 ft. or less high, with many slender spreading or ascending branches clothed with short silky hairs; leaves oblong-linear. 1-2 cm. l.; stipules wanting; pods glabrous, about 7 mm. l.—Griseb. op. cit. 179; Wils. loc. cit.; Bak. tom. cit. 71.

Wilson; Fairfield, Manchester, Wullschlaegel.—India, Burma, Ceylon. Leaves mucronulate, with silky pubescent adpressed hairs chiefly beneath, 4-6 mm. br. Racenes few-flowered. Calyx 2-lipped, with long silky hairs, about '5 cm. l. Pod ellipsoidal, black.]

**Stipules decurrent.

3. C. sagittalis L. Sp. Pl. 714 (1753) (in part); stipules all acute.—Urb. Symb. Ant. iv. 280. C. frutescens hirsuta, flore luteo, ramulis alatis, foliis mucronatis Houst. MS. 101, f. 139. C. fruticosa *Macf. Jam. i.* 240 (1837).

Houstoun! Macfadyen; Job's Hill, St. Mary, McNab! Newcastle, J.P. 1434, Hart! Pen Hill, 2500 ft.; Tweedside, south St. Andrew, 2500 ft.; Salt Hill, St. Andrew, 3800 ft.; bed of river, Castleton, 490 ft.; Harris! Golden Spring, 800 ft., Thompson! Fl. Jam. 5804, 6923, 8035, 11,855, 11,965.—Hispaniola, Porto Rico, continental America from New England to Peru.

Somewhat shrubby, generally about 1 ft. high, more or less villose with whitish or yellowish hairs, mostly adpressed. Leaves linear, linear-oblong, or linear-lanceolate above, oblong below, sparsely hairy on upper surface, hairy on margin and on midrib beneath, 2·5-6 (1·5-7) cm. l.; stipules well developed on stem and upper parts of branches, wanting below or represented by linear bracts, free portion lanceolate, acute. *Bacemes* few-flowered. *Bracts* linear, 5-8 mm. l.; bracteoles linear, 4-7 mm. l. *Flowers* tawny-yellow (rarely white). Calyx 7-13 mm l. Standard and wings about half as long as the calyx; keel a little longer than the standard. Pod oblong, black, glabrous, 2-3 cm. l.

Var. fruticosa var. nov.; 2-4 ft. high; leaves linearlanceolate, grevish-pulverulent especially beneath, 3-7 cm. l.— C. fruticosa Mill. Gard. Dict. ed. 8 (1768).

Houstoun, seeds sent from Jamaica and grown in Chelsea Physic Garden by Miller, specimens in Herb. Mus. Brit.! Devon Pen, near Castleton, 300 ft. Thompson! Fl. Jam. 7973.

4. C. pterocaula Desv. Journ. Bot. iii. 76 (1814); stipules mostly obtuse.—Benth. in Fl. Bras. xv. pt. 1, 19, t. 2; Griseb. op. cit. 178 (excl. syn.).

"Hollis's savanna, St. Ann & Clarendon," Purdie!—Trinidad, Panama,

tropical South America.

Shrubby, 2 ft. high, the whole plant covered with brownish-yellow adpressed hairs. Leaves linear-lanceolate, densely hairy on both sides, 2-4(-8) cm. 1.; stipules variable, some at least obtuse, others toothlike or lanceolate. Racemes few-flowered. Bracts lanceolate, 5 mm. l.; bracteoles lanceolate, 3 5-4 mm. l. Calyx 11-12 mm. l. Standard 8-9 mm. l.; wings shorter than standard; keel a little longer. Pod 3-4 cm. l.

§ 2. Leaves 3-foliolate.

5. C. lotifolia L. Sp. Pl. 715 (1753) (by error latifolia); leaflets narrowly elliptical; peduncles 1- or few-flowered, axillary, short; calvx about 8 mm. 1., exceeded by the corolla; pods puberulous.—Macf. Jam. i. 240; Griseb. op. cit. 180; Urb. Symb. Ant. iv. 281. C. trifolia fruticosa foliis glabris &c. Sloane Cat. 141 & Hist. ii. 33. C. loti folio &c. Dill. Elth. 121, t. 192, f. 121. Type in Herb. Mus. Brit.

Between the Town Savanna and Two Mile Wood, Sloane Herb. vi. 5! Shakspear! Masson! Macfadyen! Great Valley, Manchester, Purdie! Great Goat Is., Harris! Fl. Jam. 9323.—Cuba, Hispaniola, Porto Rico, St. Thomas, St. Cruz.

Shrubby, to 6 ft. high; branches tomentellous. Leaflets 5 cm. 1., petioles and under surface silky pubescent; stipules minute. Cally, 5 partitle pubescent. Ped charaid chlora apart rupeate about 2 cm. 1.

5-partite, pubescent. Pod obovoid-oblong, apex truncate, about 2 cm. 1.

6. C. pumila Orteg. Hort. Matr. 23 (1800); leaflets oblanceolate or narrowly oblanceolate-oblong, 1-2.5 cm. l.; calyx 3 mm. l., corolla twice as long; pod puberulous, 1-1.5 cm. l. —Griseb. op. cit. 179; Hemsl. Biol. Centr. Amer. Bot. i. 227. C. lupulina H. B. & K. Nov. Gen. & Sp. vi. 402, t. 590 (1824). C. litoralis H. B. & K. tom. cit. 401 (1824).

St. Ann, McNab! March! St. Ann's Bay, Prior! also Harris! Fl. Jam. 10,368.—Florida and Keys, Bahamas, Cuba, St. Kitts, Antigua, St. Vincent,

Arizona, New Mexico, Texas, Mexico, Venezuela.

Perennial, to 3 ft.; branches diffuse or decumbent, pubescent or glabrate. Leaflets puberulous beneath; stipules setaceous, deciduous. Racemes about 9- or 10-flowered, or corymbiform 2-3-flowered. Calyx 5-partite, puberulous or glabrescent. Pod oblong.

7. C. incana L. Sp. Pl. 716 (1753); leaflets broadly elliptical obovate; racemes 5-many-flowered; calyx 7-10 mm. l., exceeded by the corolla; pods pilose with spreading hairs.— Macf. Jam. i. 242; Griseb. op. cit. 180; Urb. tom. cit. 281. C. trifolia fruticosa foliis rotundis &c. Sloane Cat. 141 & Hist. ii. 34, t. 179, f. 1. Specimens in Herb. Mus. Brit. from Hort. Cliff. & Sloane.

Common, Sloane Herb, vi. 6! Barham and Lane in Herb, Sloane clxii, 76! Wright! Liguanea, Broughton! Macfadyen; Distin! St. Mary, McNab! March! Prior! J.P. 875 Morris! Areadia, Mrs. Sewell! Chester Vale, Harris! Barbican, Liguanea plain, 450 ft., Campbell! Providence, 700 ft., Thompson! Fl. Jam. 5930, 8055a; Bog Walk, Port Morant, Lucea, Hitchcock; Porus, Lloyd.—Tropical and subtropical regions.

Annual, 2-4 ft. high, shrubby, erect, pubescent. Leaflets pubescent beneath or glabrescent, 2-3·5(-5) cm. l.; stipules setaceous, deciduous. Flowers greenish-yellow, 10-12 mm. l. Calyx 5-cleft, pubescent. Pod

oblong, pendulous, about 3 cm. l.

8. C. striata DC. Prodr. ii. 131 (1825); leaflets elliptical, $3-9\cdot 5(-12)$ cm. l.; calyx-segments lanceolate, $4-4\cdot 5$ mm. l., corolla more than twice as long as the calyx: pod glabrous, about 4 cm. l.—Bot. Mag. t. 3200; Macf. Jam. i. 241; Griseb. op. cit. 180; Bak. tom. cit. 84. !C. mucronata Desv. Journ. Bot. 1814, 76. C. Brownei Bert. ex DC. Prodr. ii. 130 (1825); Reichenb. Ic. Exot. t. 232. C. Hookeri Arn. in Ann. Sc. Nat. sér. 2, iii. 248 (1835). C. striata var. acutifolia Trim. Cat. Ceyl. Pl. 22 (1885). (Fig. 1.)

Common; in fl. Oct.-Dec.; Macfadyen; St. Mary, McNab! St. George's Gap, Purdie! Parnell! Wullschlacgel; March! Prior; Gordon Town, Ball! Hope River, 1200 ft., Eggers! Cinchona, 5000 ft., J.P. 1174, Morris! Johnson! Castleton road, 600 ft., Thompson! Fl. Jam. 8093, Blue Mt. Peak; Lucea; Hitchcock.—Tropics.

Shrubby, to 4 ft. high, erect, puberulous. Leaflets, apex mucronulate, acute, rounded or retuse, cuneate at base, puberulous or glabrate beneath; stipules wanting. Racemes sometimes as long as 3 dm., many-flowered. Flowers about 1.5 cm.l. Calyx 5-fid, 2-lipped. Corolla: standard 1 cm.l.; wings oblong, acute (or obtuse), blade about 1 cm.l.; keel 1.5 cm.l., with a rounded knee in the middle. Pod cylindrical.

§ 3. Leaves 5-foliolate.

[C. quinquefolia L. Sp. Pl. 716 (1753).—Griseb. loc. cit.; Wils. loc. cit.; Bak. tom. cit. 84.

Wilson!-East Indies to Philippines.

Annual, 2 ft. high, erect, puberulous or glabrescent. Leaflets 5, linearlanceolate, puberulous beneath, 2-7 cm. 1.; stipules minute, awl-shaped. Racemes many-flowered. Bracts linear-lanceolate, reflexed. Calyx 5-fid, glabrous, half the length of the corolla. Pod oblong-ellipsoidal, glabrous, about 5 cm. 1.]

[ULEX L.

Shrubs with spiny branches. Leaves 3-foliolate in seedling plants, in mature plants spinescent without leaflets or reduced to small scales. Stipules none. Flowers yellow, axillary at the ends of the branches. Calvx coloured, 2-partite, 5-toothed. Staminal sheath closed.

About 20 species in the west of Europe and 2 in the Mediterranean region.

U. europæus L. Sp. Pl. 741 (1753); Macf. Jam. i. 242; Griseb. Fl. Br. W. Ind. 180. Type in Herb. Linn.

Furze, Gorse, Whin.

Naturalized in the Blue Mts.; Macfadyen; Morris! Catherine's Peak, 4000 ft., Eggers!—This species is found not only in western Europe, where its considered truly native, but also in N. America, Mexico, Chili, Canary Is., Nilgiri Mts., India, Philippines, Australia and New Zealand, in which countries it is looked upon as an introduction.]

§ 2. Herbs. Leaves digitately 3-foliolate, leaflets denticulate. Flowers in heads axillary. Stamens 10, uppermost usually free, the rest united into a sheath. Pod small, enclosed in the withered calyx and corolla, not opening.

2. TRIFOLIUM L.

Species 300, numerous in temperate and subtropical regions of the northern hemisphere, a few in the mountains of tropical America, in temperate S. America, and in Africa.

T. repens L. Sp. Pl. 767 (1753); stem creeping; flowers white (sometimes pinkish) in large heads.—Macf. Jam. i. 243; Griseb. Fl. Br. W. Ind. 181. (Fig. 2.) Type in Herb. Linn.

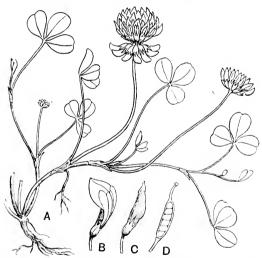

Fig. 2.—Trifolium repens 1..

A, Portion of plant $\times \frac{\pi}{3}$. B, Flower $\times 2$. C, Pod enveloped in the persistent calyx and corolla × 2.

D, Pod with one valve removed \times 2.

Dutch or White Clover.

Common in mountains, Macfadyen; Cold Spring, J.P. 1223, Morris! Blue Mt. Peak, Hitchcock.—Continental America, Europe, Asia.
Perennial, glabrous. Leaflets roundish-obovate, 1-1.5 cm. l. Peduncle

longer than the leaves. Flowers shortly stalked, at length deflexed. Calyx glabrous, half as long as the corolla, with lanceolate erect unequal teeth. Pod 4-6-seeded.

[T. dubium Sibth. Fl. Oxon. 231 (1794); stem prostrate; flowers yellow in small heads.—T. filiforme Mact. loc. cit. (non L.): Griseb. loc. cit. T. minus Relhan Fl. Cantab. ed. 2, 290 (1802).

Shamrock.

Common in the mts., Macfadyen; McNab! Wilson; Morris! Mrs. Espeut! Blue Mt. Peak, Hitchcock.—N. America, naturalized from Europe. Annual, stem slender. Leaflets obovate, emarginate, serrulate, the middle leaflet stalked, 4-7 mm. l. Flowers yellow, about 12 in close heads. Standard truncate, covering the pod.

§ 3. Herbs (woody below) or shrubs, not twining, sometimes arborescent (in Sesbania). Leaves imparipinnate or abruptly pinnate (in Sesbania), petiole not bearing a tendril, leaflets entire. Flowers in racemes, axillary, terminal, or opposite the leaves. Stamens 10, the uppermost free, or more or less free, the rest united into a sheath, split above. Pod 2-valved, or sometimes scarcely opening (in Sesbania).

3. INDIGOFERA L.

Shrubby herbs or shrubs; hairs often attached by the middle. Leaves imparipinnate (in Jamaican species), sometimes with 1 or 2 leaflets only in I. lespedezioides. Flowers in racemes, axillary (in Jamaican species), variegated-purplish. Calyx 5-cleft. Standard roundish, often persistent; keel usually with a spur on each side. Uppermost stamen free, the rest united into a slender persistent sheath; anthers apiculate. Pod narrow, cylindrical, 4-angled or flat-compressed, with partitions between the seeds.

Species 350, dispersed through the warmer regions of the

world, most numerous in southern and tropical Africa.

Pod straight or only slightly curved, with 8-15 seeds. Leaflets in 4-6 pairs, oblong-obovate to roundish-

Racemes as long as or longer than the leaf 4. I. lespedezioides.

1. I. tinetoria L. Sp. Pl. 751 (1753); leaflets in 4-6 pairs, oblong-obovate to roundish-obovate, apex rounded, mucronulate, glabrous on the upper surface, strigillose beneath; racemes shorter than the leaf; pods slightly curved or straight, with 8-12 seeds.—Wright Mem. 293 (I. suffruticosa); DC. Prodr. ii. 224 (excl. β); Macf. Jam. i. 245; Bentl. & Trim. Med. Pl. t. 72;

H, Ripe seed × 3.

I, Ditto cut lengthwise × 3.

Shrub, about 2 ft. high; ends of branches white-strigillose. Leaglets 1-2 cm. l.; stipules small, awl-shaped, deciduous. Calyx 5-fid, segments triangular. Corolla: standard broadly elliptical, vermilion-tinged inside, 5-6 mm. l., 3 5 mm. br.; wings oblong-spathulate, shorter than the keel, about 4.5 mm. l.; keel oblanceolate, greenish, ciliolate at the apex, about as long as the standard. Pod linear-cylindrical, slightly torulose, thickened along both margins, reflexed, strigillose, 2.5-3.5 cm. l. Seeds cylindrical, terete or angled, about 2 mm. l., without any depression at the scar of attachment.

There are three pages (viz. 7, 8, 9) with specimens of *Indigofera* in Herb. Sloane vi. The specimens on page 7 have the slightly curved many-sided pod of I. tinctoria L., but some ripe pods of I. suffruticosa Mill. have also been inserted. The plate 179, f. 2, is taken from one of these

specimens, but the pods have been drawn much thicker than they are in the original, and apparently gave rise to De Candolle's varietal name macrocarpa. The specimen on page 9 with few-seeded, sickle-shaped pods is I. suffraticosa Mill. There are three specimens on page 8. That on the left is the original of the plate 176, f. 3, and it and the specimen at the bottom of the page, though without pods, appear to be conspecific with the specimens on page 7, i.e. I. tinctoria L. The specimen on the right of the page agrees quite well with that on page 9, and is I. suffraticosa Mill. The specimen of I. tinctoria in Linnæus's Herbarium agrees well with Sloane's specimens.

The label attached to page 7 is the diagnosis of Hist. ii. 34; that of page 8 is the diagnosis of Hist. ii. 37. It is quite clear from the diagnoses that they refer respectively to I. tinctoria L. and I. suffruticosa Mill., and it is unfortunate that there has been a mixing of the specimens, and that the artist copied the wrong specimen for t. 176, f. 3, with which the

description in the text does not correspond.

2. I. suffruticosa Miller Gard. Dict. ed. 8 (1768); leaflets in 5-6 pairs, oblong, narrowing equally to both ends, generally acute, mucronulate, strigose on both sides, especially beneath; racemes shorter than the leaf with crowded flowers; pods sickle-shaped, with 3-6 seeds.—I. anil L. Mant. 272 (1771); Macf. Jam. i. 244; Prain and Bak. f. tom. cit. 137. I. Guatimala Lun. Hort. Jam. i. 420 (1814). I. tinctoria Wright Mem. 293 (1828) (non L.). I. anil L. var. polyphylla DC. Prodr. ii. 225 (1825). Colutea affinis fruticosa argentea, floribus spicatis e viridi purpureis, siliquis falcatis Sloane Cat. 142 & Hist. ii. 37 (omit t. 176, f. 3). Indigofera assurgens subvillosa &c. & I. assurgens minusque &c. Browne Hist. Jam. 302. Specimens from Herb. Miller in Herb. Mus. Brit. The specimen of I. anil in the Linnean Herbarium agrees well with Miller's specimen of I. suffruticosa and with Sloane's specimens.

Wild Indigo, Guatimala Indigo.

Barham in Herb. Sloane clxxxiv. 8! Sloane Herb. vi. 8 & 9! (omitting left and bottom specimens on 8); Lane in Herb. Sloane clxii. 82! Wright! Macfadyen! Liguanea; Hopewell, St. Mary; McNab! Purdie! March! Resource, Blue Mts., 3400 ft., J.P. 1252, Haht! Gordon Town, Ball! Mavis Bank, Johnson! Kingston, Hitchcock; Porus, Lloyd.—Bermuda, Bahamas, West Indies, tropical continental America, also Africa and Asia (where possibly it has been introduced).

Shrub; stem and branches densely white-strigillose. Leaflets 2-3 cm. l., stipules awl-shaped. Calyx 5-fid, segments subequal, triangular, 1·3 mm. l. Corolla: standard broadly elliptical, 4·5 mm. l.; wings oblanceolate, nearly as long as the keel; keel oblanceolate, nearly as long as the standard, with a spur on each side near the middle. Pod oblong-linear, slightly torulose, much thickened along both margins, reflexed, short, strigillose, 1-1·5 cm. l. Seeds cylindrical, terete, about 2·2 mm. l., with depression

at the scar of attachment.

Form obtusifolia; leaflets elliptical or narrowly elliptical, generally obtuse or subobtuse, glabrous or sparingly strigose on upper surface, strigose beneath.

Resource, Blue Mts., 3400 ft., Harris! Yallahs Valley; Golden Spring, 800 ft., Thompson! Fl. Jam. 6142, 7987.

3. I. subulata Poir. Encyc. Suppl. iii. 150 (1813); leaflets in 2-3(-1) pairs, elliptical, apex rounded or obtuse, strigose on both sides; racemes longer than the leaf with long peduncle; pods straight or only slightly curved, with 10-15 seeds.—DC. Prodr. ii. 223; Bak. in Hook. f. Fl. Br. Ind. ii. 96; Griseb. loc. cit. I. mucronata Spreng. ex DC. tom. cit. 227; Macf. Jam. i. 245.

Broughton! common, Port Royal and St. Andrews Mts., Macfadyen! Yallahs River, Purdie! March; Agualta Vale, Metcalfe! Kingston, Prior! also Clute! Gordon Town, Ball! Guava Ridge, 2000 ft., Eggers! Hope, Harris! Golden Spring, 800 ft., Thompson! Constant Spring; Port Morant; Hitchcock! Porus, Lloyd! Fl. Jam. 6852, 8066.—Tropical and subtropical

regions.

Shrubby, stem and branches white-strigose. Leaflets 2-4 cm. l., 1-1·8 cm. br.; stipules long, filiform, acuminate, about 6 mm. l. Racemes 1-1·5 dm. l., sometimes to nearly 3 dm. l. Calyx 5-partite, 2·5-3 mm. l.; segments lanceolate, acuminate, subequal. Corolla: standard roundish-rhomboidal, vermilion-coloured on the inside, pale outside with a green nerve, 4·5 mm. l., 4 mm. br.; wings oblong, apex broader, rounded, ciliolate at apex, as long as the standard; keel as long as the standard, white, upper edge tinged with red, and ciliate. Pod linear-cylindrical, not torulose, thickened especially along the dorsal margin, reflexed, strigillose, 2·5-4·5 cm. l. Seeds 2 mm. l., linear, 4-angled, with a depression at scar of attachment.

4. I. lespedeziodes H. B. & K. Nov. Gen. & Sp. vi. 457 (1824); leaflets variable in size and number, 1 or 2, or with simple leaves only below and 1 to 4 pairs above, oblong and slightly tapering to the base, apex obtuse, mucronulate or emarginate-retuse, strigose on both sides; racemes about as long as the leaf or longer, with several flowers; pod straight, with about 10 seeds. — DC. tom. cit. 226; Benth. in Fl. Bras. xv. pt. 1, 39 t. 5.

Liguanea Ridge, St. Andrew, 1000 ft.; on land recently burnt over, Lititz Savanna, 300-900 ft.; Harris! Fl. Jam. 11,745, 12,204.—Tropical

S. America.

Shrubby, 2-3 ft. high; young branches slightly angled, slightly strigillose or glabrate. Leaflets, 3-1 cm. l., 7-5(-2) mm. br.; stipules lanceolate-setaceous, about 2·5 mm. l. Calyx 5-fid, tube about 1 mm. l.; segments triangular-acuminate, 1·3 mm. l. Corolla reddish, standard roundish, reflexed, about 5 mm. l.; wings obliquely oblanceolate, a little shorter than the keel; keel about as long as the standard, with spurs about the middle. Pod linear-cylindrical, not torulose, slightly thickened along each margin, reflexed, strigillose or glabrescent, 2·5-3 cm. l.

Various species of Indigofera have been successfully used as cover crops,

protecting the soil from wash on sloping ground.

Macfadyen states (Flor. Jam. i. 244) that *I. argentea* L. "was formerly a common weed in the Botanic Garden at Bath." We have not seen specimens from Jamaica.

4. TEPHROSIA Pers.

Shrubby herbs or shrubs. Leaflets numerous, with parallel oblique nerves, underneath often silky. Flowers in clusters of 2-6 arranged in racemes terminal or opposite the leaves, or in

upper axils, often leafy at the base. Uppermost stamen more or less free. Pod compressed, beaked with the persistent style.

Species 120, widely spread through the warmer regions of the world, numerous in South Africa and Australia, a few in North America.

Leaflets in 12–20 pairs; pod 4·5–7 cm. l		T. toxicaria. T. candida.]

Surinam Poison.

Lane in Herb. Sloane clxii. 85! "Cultivated, rarely wild," Macfadyen; Brandon Hill, 1000 ft. (fls. white) Thompson! Mavis Bank (cult.). Fl. Jam.

8045.—West Indies, tropical continental America.

Shrubby, 2-5 ft. high; branches velvety. Leaves 1-2 dm. l., leaflets narrowly oblong, shortly stalked, silky-pubescent, especially beneath, stipules awl-shaped. Flowers white with a purplish tinge, in clusters of 4-6 in many-flowered racemes, 1-3 dm. l. Calyx silky, about 5 cm. l.; segments ovate. Corolla: standard silky outside, roundish, clawed, 1.2 cm. l. (or more); wings and keel about as long as standard. Pod silky-pubescent. pubescent.

Browne (loc. cit.) states: "This plant has been introduced to Jamaica from the main, and is now cultivated in many parts of the island, on account of its intoxicating qualities.... The leaves and branches being well pounded, and thrown into any river, pond, or creek, are observed to infect the waters very soon; by which all the fish are immediately intoxicated, and rise and float upon the surface, as if they were dead; from whence they are easily taken. But most of the large ones that are left, recover from this trance after a short time, though the greatest part of the small fry perish on those occasions."

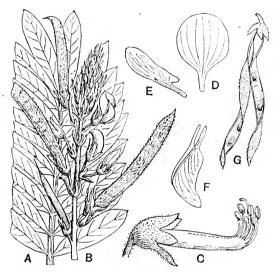

Fig. 4.—Tephrosia toxicaria Pers.

(After Fl. Bras.)

2. T. purpurea Pers. Syn. ii. 329 (1807); ascending; leaflets in 6-10 pairs; calyx 3-3·5 mm. l., teeth as long as the tube, acuminate; blade of standard elliptical-roundish, broader than long, 6 mm. l., 7·3 mm. br.; claw cuneate, 2 mm. l.; pod 6-seeded (3-5-), 3-4 cm. l., glabrous or strigillose.—Bak. in Hook. f. Fl. Br. Ind. ii. 112; Robinson in Bot. Gaz. xxviii. 201. T. leptostachya DC. Prodr. ii. 251; Benth. tom. cit. 48; Griseb. loc. cit. T. ascendens Macf. Jam. i. 257 (1837). Cracca purpurea L. Sp. Pl. 752 (1753). Galega purpurea L. Sp. Pl. ed. 2, 1063 (1763). Coronilla zeylanica herbacea &c. Burm. Zeyl. 77, t. 32. Cracca leguminibus strictis adscendentibus glabris racemosis &c. L. Fl. Zeyl. 140. Type in Herb. Hermann in Herb. Mus. Brit.

Lane in Herb. Sloane clxii. 83! Houstoun! Shakspear! Macfadyen! Clermont, St. David, McNab! Hope River Mouth; Liguanea Ridge,

St. Andrew, 1000 ft.; Harris! Fl. Jam. 9385, 12,205.—Tropical and

subtropical regions.

Somewhat shrubby, rising to 1 or 2 ft. high, branches glabrous or adpressed pubescent, angular. Leaflets linear-oblong to narrowly oblanceolate, glabrescent on the upper surface, glaucous, obscurely silky with minute white hairs beneath, 1-2 cm. l., 2-5 mm. br.; stipules 4-7 mm. l., lanceolate-awl-shaped. Flowers pale purplish or white, or crimson, solitary or in clusters of 2 or 3 in racemes, which are opposite to a leaf, lax-flowered, to 1 dm. l. Calyx with minute adpressed hairs. Corolla: standard silky outside; wings, blade oblong, about 5 mm. l., claw about 2.5 mm. l.; keel about as long as wings. Style glabrous; stigma with very short hairs. This species has been used for green dressing.

3. T. Wallichii Graham in Wall. Cat. n. 5640 (nomen); Fawc. & Rendle in Journ. Bot. lv. 35 (1917); leaflets in 5-9 pairs; calyx 4·5-5 mm. l., teeth nearly twice as long as the tube; blade of standard elliptical-roundish, broader than long, 6 mm. l., 8 mm. br., claw cuneate, 2 mm. l.; pod 5-6 seeded, 3-3·5 cm. l., puberulous or glabrous. Type in Herb. Wallich in Herb. Kew.

Broughton! Palisadoes, Harris! Fl. Jam. 6753.—Dominica, Trinidad,

Guiana, India.

Somewhat shrubby; branches glabrous or pubescent, at length terete. Leaflets cuneate-oblong, green, glabrescent on the upper surface, glaucous and obscurely silky with minute white hairs beneath, $1\cdot 5-2\cdot 5$ cm. l., $\cdot 5-1\cdot 5$ cm. br.; stipules 5-7 mm. l., linear-lanceolate. Flowers crimson or white, solitary or in clusters of 2 or 3 in racemes, which are opposite to a leaf, lax-flowered, to 1 dm. l. Callyx with minute adpressed hairs; segments setaceous. Corolla: standard silky outside; wings, blade oblong, about 5 mm. l., claw about $1\cdot 5$ mm. l.; keel, apex close to apex of wings. Style glabrous; stigma with very short hairs.

4. T. einerea Pers. Syn. ii. 328 (1807); more or less procumbent; leaflets in 3-5 (6) pairs; calyx 4·5-6 mm. l., teeth as long as the tube to half as long again; blade of standard roundish, rhomboid-roundish, or ovate-roundish, 8·5-9 mm. l., 9 mm. br., claw 2·5 mm. l.; pod generally 8-10-seeded, 4-5 cm. l., with minute white adpressed hairs.—Benth. tom. cit. 48; Griseb. loc. cit.; Urb. Symb. Ant. iv. 283. T. procumbens Macf. Jam. i. 256. Galega cinerea L. Syst. ed. 10, 1172 (1759) & Amen. v. 403; Jacq. Ic. Pl. Rar. t. 575. Galega herbacea &c. Browne Hist. Jam. 289. Type in Herb. Linn.

Wright! Broughton! Shakspear! Macfadyen! Distin! St. Andrew, McNab! Constant Spring, 1000 ft.; Palisadoes; Harris! Fl. Jam. 6088,

6752.—West Indies, tropical and subtropical America.

Somewhat shrubby; branches 1 ft. or more long, at length terete, white-pubescent with adpressed or spreading hairs. Leaflets oblanceolate-oblong, glabrescent or with minute adpressed hairs on the upper surface, silky-pubescent and ash-coloured beneath, 1·3-3 cm. l. (or more in var.), 3-5 mm. br. (or more in var.); stipules white-pubescent, lanceolate, 5-6 mm. l. Flowers showy, rose-coloured, solitary or in clusters of 2 or 3 in racemes, which are opposite a leaf, and to 1·5 dm. l. Calyx silky with long white hairs. Standard silky outside; wings, blade 9 mm. l., 4 mm. br., claw 2·2 mm. l.; keel, claw about 1 cm. l. Style glabrous; stigma long-ciliate.

Var. littoralis Benth. iu Fl. Bras. xv. pt. 1, 48 (1859); pubescence denser, and on petioles and branches spreading; leaflets in 5-6 pairs, larger, 2-4 cm. 1., 5-12 mm. br.—Griseb. loc. cit. T. littoralis Pers. Syn. ii. 329 (1807). Vicia littoralis Jacq. Sel. Stirp. Amer. 206, t. 124 (1763). Galega littoralis L. Syst. ed. 12, 497 (1767); Jacq. Sel. Stirp. Amer. ed. pict. t. 192 (1780?). Jacquin's original specimen from which t. 124 and the coloured t. 192 were drawn, is in Herb. Mus. Brit.

Macfadyen! King's House grounds, 600 ft., Harris! Fl. Jam. 6956.—Colombia, Guiana, Brazil.

[T. candida DC. Prodr. ii. 249 (1825); leaflets in 9-12 pairs, 3-5 cm. l.; flowers 2-2·5 cm. l.; pods 8-10 cm. l.—Bak. in Hook. f. Fl. Brit. Ind. ii. 111.

Naturalized, presumably an escape from the Botanic Gardens; Morris! near Castleton; near Hope Bay; Harris! Golden Spring, 800 ft., Thompson!

Fl. Jam. 6031, 7988, 9040, 11,804.—India, Malay Is.

Shrub 4-10 ft. high, bushy; branches covered with velvety pubescence. Leaves 1.5-2.5 dm. l.; leaflets narrowly oblong, acute, glabrous on upper surface, grey and silky beneath. Flowers reddish, yellow or white, solitary or in clusters in terminal and lateral racemes which are long or contracted (to 1.5 dm. l.). Calyx densely silky, about 5 mm. l.; teeth deltoid, shorter than the tube. Corolla white; standard densely silky outside, about 2 cm. l. Pod 10-15-seeded, straight or slightly recurved, with adpressed brown silky hairs.]

This species and others have been used as cover crops and green

dressing.

[T. noetiflora Bojer ex Bak. in Fl. Trop. Afr. ii. 112 (1871); leaflets in 6–9 pairs, narrowly oblanceolate, apex rounded or emarginate, mucronate, 2·5–4·5 cm. l., 5–8 mm. br.; stipules filiform, villose, 6–9 mm. l.; calyx pubescent with long reddishyellow hairs; tube 2 mm. l., the lower tooth lanceolate, equalling the tube, the others shorter and deltoid; pod 8–9-seeded, 4–5 cm. l., 5–6 mm. br., densely clothed with fine brown silky hairs, slightly curved upwards.

Naturalized; Brandon Hill, 1000 ft., Thompson! Asylum grounds, near Kingston, Plaxton! also Fawcett! King's House grounds, 600 ft., Harris!

Fl. Jam. 6952, 8054.—Africa.

Spreading shrubby plant, 4-6 ft. high, densely clothed with short brown pubescence. Leaves 8-13 cm. l.; petiole pubescent; leaflets glabrous on upper surface, silky and grey beneath with adpressed hairs. Flowers white, standard variegated with purple, in small remote clusters in a raceme which is opposite a leaf, 1·5-3·5 dm. l. Corolla: standard pubescent on the outside, ovate-roundish, apex deeply emarginate and retuse, 8 mm. l., about 1 cm. br., claw 2 mm. l.; wings, obovate-oblong, blade 8 mm. l., claw 2 mm. l.; keel blade 8 mm. l., claw 2 mm. l., apex close to apex of wings.

[T. grandiflora Pers. Syn. ii. 329 (1807); leaflets in 5-7 pairs, 1-2 cm. l.; flowers 2-2·5 cm. l.; pod glabrous (except on the margins), about 5 cm. l.—Harv. in Fl. Cap. ii. 209; Griseb.

loc. cit. Galega rosea Lam. Encyc. ii. 599 (1786). G. grandiflora Vahl Symb, ii, 84 (1791).

Naturalized in Blue Mts., Wilson; Prior; Cinchona, J.P. 1176, Morris!

also Clute! Blue Mt. Peak, Hitchcock.—S. Africa, Rhodesia to Cape.
Shrubby, erect, 1-2 ft. high; stem and branches puberulous or subglabrous. Leaglets oblong, glabrous on the upper surface, puberulous or glabrous. Leafers onlying, glabrous on the upper surface, published of glabrescent beneath, 3-5 mm. br.; stipules ovate, acute, many-nerved, 5-8 mm. l. Flowers showy, rosy-purple, large, in corymbose clusters at ends of branches. Bracts broadly ovate, enclosing the young flower-bud, deciduous. Calyx puberulous-silky, 5-7 mm. l.; segments awl-shaped. Corolla: standard silky outside, blade roundish, about 2 cm. 1.7

[GLIRICIDIA H. B. & K.

Trees or shrubs. Leaves alternate, here and there subopposite; leaflets entire, opposite. Racemes appearing before the leaves, or axillary. Calyx campanulate, entire or obsoletely 5-toothed. Standard roundish, reflexed, clawed, with 2 lobes inside above the claw; wings oblong, free; keel curved. Uppermost stamen free. Pod broadly linear, flat-compressed, margins slightly thickened. Seeds 3-6, flat, roundish-elliptical.

Species 3 or 4, natives of tropical America.

G. sepium Steud. Nomencl. ed. 2, i. 688 (1841); Urb. Symb. Ant. ii. 288, iv. 284. G. maculata Steud. loc. cit. Robinia sepium Jacq. Enum, Pl. Carib. 28 (1760) & Sel. Stirp. Amer. 211.

Cultivated for fences and subspontaneous in West Indies: Hope, Harris!

Fl. Jam. 8453.—Native in Central America and Colombia.

Small tree or shrub to 20 ft. high. Leaflets in 4-8 pairs, lanceolate, elliptical, or ovate, 3-6 cm. l., glabrous. Calyx ·5 cm. l. Corolla lilacrosy and white; standard (excl. claw) about 2 cm. l., claw ·5 cm. l.; wings (incl. claw) about 2 ·3 cm. l.; keel (incl. claw) about 1 ·8 cm. l., claw 6 mm. l. Style bent at a right angle to pistil. Pod 10-12 cm. 1., 1 to nearly 2 cm. br. Seeds about 1 cm. l.

5. SESBANIA Scop.

Herbs or shrubs (in S. grandiflora arborescent but short-lived). Leaves abruptly pinnate, leaflets entire in many pairs. Racemes axillary, lax. Calyx 5-toothed (or in S. grandiflora campanulate, toothed-wavy). Standard roundish or ovate. Uppermost stamen free, the rest united into a sheath; anthers all alike or the alternate a little longer. Pod long, with transverse partitions between the seeds, 2-valved or sometimes scarcely opening.

Species 20, widely dispersed through the tropics.

Flowers not more than 1 inch long; buds straight.

Plants glabrous. Leaflets in less than 20 pairs............................... 1. S. Sesban. Leaflets in more than 20 pairs. Flowers 2-2·4 cm. l... 2. S. exasperata. [Flowers 1–1·2 cm. l. S. bispinosa. Plants pubescent 3. S. sericea. Flowers 3 inches long; buds curved S. grandiflora.

1. S. Sesban comb. nov.; glabrous; branches without prickles; leaflets in 10-18 pairs; flowers 1.5-1.8 cm. l.—S. agyptiaca Pers. Syn. ii. 316 (1807); Wight Ic. t. 32; Griseb. Fl. Br. W. Ind. 184; Bedd. Fl. Sylv. Anal. Gen. t. 12, f. 3; Bak. in Hook. f. Fl. Brit. Ind. ii. 114; Urb. Symb. Ant. iv. 286. Sesban Alp. Pl. Egypt. t. 82. Eschynomene Sesban L. Sp. Pl. 714 (1753). (Fig. 5.) Type in Herb. Linn.

Seashore, Wilson! March! cult. Hope Gardens, Harris! Fl. Jam. 8617.—Cuba, Porto Rico, south-castern America, tropical and subtropical Africa, tropical Asia, northern Australia.

Soft-wooded shrub 6-10 ft. high. Leaves 1-1.5 dm. l.; leaflets oblonglinear, 2-3 cm. l., ·5 cm. br. Racemes 3-12-flowered, 3-15 cm. l. Calyx,

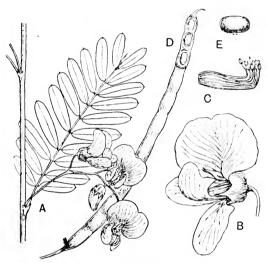

Fig. 5.—Sesbania Sesban Fawc. & Rendle.

- A, Portion of flowering branch $\times \frac{2}{3}$. B, Flower partly opened $\times \frac{\pi}{2}$. C, Stamens $\times \frac{\pi}{2}$.

D, Pod, partly opened to show the seeds, $\times \frac{2}{3}$. E, Seed $\times 2$.

tube 4 mm. l., teeth about 1 mm. l. Corolla: standard transversely broadly elliptical, somewhat cordate, 1.5-2 cm. l., 1.7-2.3 cm. br.; 2 large calli at the base running down into the claw, above the base free, lanceolate, acuminate; wings, blade 14 cm. l., claw about $^{\circ}$ 5 cm. l.; keel, blade short, $^{\circ}$ 7-8 cm. l., claw as long. Pod 15-23 cm. l., slightly torulose, compressed, at length cylindrical, beaked with the persistent style. The colour of the flowers is very varied; some are creamy white with standard finely streaked beneath with dark purple, some are bright yellow, others yellow or creamy white with standard edged with dark red, and some variegated orange and scarlet.

2. S. exasperata H. B. & K. in Nov. Gen. & Sp. vi. 534 (1824); glabrous; branches generally without any prickles, but sometimes rough; leaflets in 30-40 (25-50) pairs; flowers 2-2 · 4 cm. 1.—Benth. in Fl. Bras. xv. pt. 1, 42; Griseb. loc. cit.; Hook, f. in Bot. Mag. t. 7384 (leaves not good).

Purdie!—Trinidad, tropical continental America.

Herb or undershrub 3-8 ft.; branches angular. Leaves 2-3 dm. 1., leaslets oblong-linear, irritable, mucronate, 1.5-2.5 cm. 1., 3-6 mm. br. Inflorescence 4-6-flowered, 8-12 cm. l. Calyx, tube 4-5 mm. l., teeth 2-3 mm. 1. Corolla: standard 2-2.5 cm. 1.; wings oblong, equalling the standard. Pod 20-25 cm. 1., compressed, only slightly or not torulose, with a long beak.

S. bispinosa Steud. Nomencl. ed. 2, ii. 572 (1841); glabrous; branches rough with short prickles; leaflets in 30-50 (20-) pairs; flowers $1-1\cdot 2$ cm. 1.—S. aculeata Pers. loc. cit. (1807); Griseb. loc. cit.; Bak. loc. cit.; Plants of Cook's First Voy. t. 63 & ic. in ed. pict. S. muricata Macf. Jam. i. 257 (1837). Æschynomene bispinosa Jacq. Ic. Pl. Rar. 13, t. 564 (1797). Coronilla aculeata Willd. Sp. Pl. iii. 1147 (1800).

Naturalized, Windward Road, *Macfadyen*! also naturalized in some other islands of the West Indies.—Tropics of Old World.

Shrub 5 ft. high. Leaves 1.5-3 dm. l.; leaflets oblong-linear, mucronate, 1-2 cm. l., 2-3 mm. br.; leaf-rhachis with small prickles beneath. Racemes 2-8-flowered, 3-7 cm. l. Calyx, tube 3-4 mm. l., teeth 1-1 5 mm. l. Carolla: standard about 1 cm. l., yellow with small purple spots outside; wings oblong. Pod 2-3 dm. l., 3 mm. br., not or only slightly torulose, compressed, at length biconvex, beaked.

3. S. sericea DC. Prodr. ii. 266 (1825); pubescent (except on upper side of the leaves); without prickles; leaflets in 12-25 pairs; flowers 8-9 mm. 1.—Griseb. loc. cit.; Urb. loc. cit. Coronilla sericea Willd. Enum. 773 (1809).

Ferry, Campbell! brackish swamps between Kingston and Spanish Town, Harris! Kingston, Hitchcock; Fl. Jam. 6171, 9051.—Bahamas, Hispaniola, Porto Rico, St. Thomas, Antigua, Guadeloupe, Martinique.

Slender branching shrub, 10 ft. high. Leaves 1-2 dm. 1.; leaflets oblong-linear, mucronate, with adpressed silky hairs beneath, irritable, 1.5-2.5 cm. 1., 4-7 mm. br. Inflorescence 4-6-flowered, about 4 cm. 1. Calyx, tube 3-4 mm. 1.; teeth about 1 mm. 1. Corolla yellow, externally tawny, standard 8-9 mm. 1., dotted with purple. Pod 1-2 dm. 1., 3 mm. br., terete, shortly beaked.

[S. grandiflora Pers. Syn. ii. 316 (1807); small tree, with large flowers, 7.5 cm. l., and curved flower-buds; leaflets in 12-22 pairs.—Urb. loc. cit. Robinia grandiflora L. Sp. Pl. 722 (1753). Æschynomene grandiflora L. Sp. Pl. ed. 2, 1060 (1763). Agati grandiflora Desv. Journ. Bot. i. 120, t. 4, f. 6 (1813); Griseb. op. cit. 183. Type in Herb. Linn.

Cultivated and apparently spontaneous, Shakspear!—W. Indies, India, Mauritius to N. Australia and Polynesia. Native country unknown, probably India or Australia.

Leaves 1.5-3 dm. l.: leaflets oblong, mucronate, 2-4 cm. l., 7-12 mm. br.

Racemes 2-flowered, very short. Calyx campanulate, toothed-wavy, about 2 cm. l. Corolla 6-7 cm. l., rosy-white or red. Pod compressed, elongate, linear, with swollen margins, slightly torulose, pendulous, to more than 3 dm. l.; seeds separated by ingrowths from the walls.

25

§ 4. Herb sometimes shrubby below, or shrubs, not twining nor climbing, or rarely shrubs, or even (in Brya) small trees. Leaves imparipinnate, leaflets 1-several, or digitately 2-4-foliolate in Zornia; petiole not bearing a tendril. Stamens 10, united into a sheath, closed or split above or both above and below, or sometimes the uppermost stamen is more or less free. Pod jointed, not or rarely opening along the lower margin; joints 1-seeded, usually breaking away from one another when ripe; sometimes by abortion of the ovules 1-jointed and 1-seeded.

6. BRYA DC.

Shrubs or small trees. Leaves imparipinnate (in B. Ebenus, 1-3 foliolate with scarcely any common petiole). Stipules (in Jamaican species) subspinescent. Flowers in axillary or subterminal cymes or clusters. Bracts and bracteoles small, persistent. Calyx 5-lobed. Standard roundish. All the stamens

Macfadyen; McNab! Lane! Blue Mts., Hitchcock; Porus, Lloyd; Craig
Hill; Hope grounds; Harris! Fl. Jam. 8635.—Cuba.

Shrub or small tree 15-25 ft. high, with clustered branches which are armed with short sharp foliar prickles subtending a reduced leafy shoot. Leaflets small, elliptical or obovate-elliptical, deciduous in dry weather, 7-17 mm. l. Flowers of a bright yellow or orange colour. Calyx about 3 mm. l. Corolla: standard about 1 cm. l., '8 cm. br.; wings 9 mm. l. (incl. claw), claw 2 mm. l. Ovary villose. Pod 2-jointed, upper joint small, abortive.

The heart wood is of rich brown, almost black, colour. It is excessively hard—as hard as ebony or lignum-vitæ—and harder than boxwood. The grain is very fine, dense and even. It is particularly adapted for turnery, and is used for flageolets, inlaying, and cabinet making. Weight 77 to

87 lbs. per cubic foot.

7. ÆSCHYNOMENE L.

Leaves irritable, imparipinate but sometimes without the terminal leaflet; leaflets numerous, small. Stipules lanceolate or ovate. Racemes generally axillary. Bracts usually stipulelike; bracteoles adpressed to the calyx. Calyx 2-lipped (in Jamaican species). Standard roundish. Stamens 10, united into a sheath, split on one side (in Æ. biflora), or on both sides (in Æ. americana). Pod, joints 2-several, square or semicircular, usually not opening.

Species about 160, of which 2 (or 3) are widely dispersed in the tropics in Asia and Africa, 1 also in Australia, 1 in S. America and also in Africa and Australia, 1 in N. America and S. Africa, 3 or 4 peculiar to Africa, all the rest American

from Patagonia to N. America.

Stipules continued below the attachment....... 1. Æ. americana. Stipules not continued below the attachment... 2. Æ. biflora.

1. E. americana L. Sp. Pl. 713 (1753); hirsute; leaflets in 10-30 pairs, linear, 3-5-nerved; stipules linear-lanceolate, continued below the attachment, the whole 1-2 cm. l.—Lam. Hart! Constant Spring, Port Morant, Port Antonio, Lucea, Hitchcock; Porus, Lloyd; Hope grounds, Harris! Fl. Jam. 6625, 6957.—West Indies, tropical continental America.

Stem somewhat shrubby, 2-3 ft., erect or ascending. Leaves 5-7 cm. l., leaflets linear, mucronate, oblique at the base, finely toothed near the apex of the lower margin, glabrous, 5-1·5 cm. l., 1-2 mm. br. Inflorescence laxly few-flowered. Flowers 6-8 mm. l. Corolla, standard flesh-colour with a tinge of yellow. Pod shortly stalked, 4-8-jointed, contracted between the seeds; joints semicircular, about 5 mm. l., 3-4 mm. in diam.

2. **E. biflora** comb. nor.; glandular-hirsute; leaflets in 4-7 pairs, elliptical or obovate-elliptical, 1-nerved with pinnate

veining; stipules ovate, many-nerved, 3–5 mm. l.—Æ. brasiliana DC. Prodr. ii. 322 (1825); Benth. tom. cit. 68; Griseb. loc. cit. Senna spuria minima &c. Houstoun MS. Cassia biflora Miller Gard. Dict. ed. 8 (1768). C. Houstoniana Collad. Hist. Cass. 132 (1816). Hedysarum brasilianum Poir. Encyc. vi. 448 (1804). Type in Herb. Mus. Brit.

Houstoun!—Cuba, St. Lucia, Trinidad, tropical continental America. Stem shrubby, 2-3 ft. high, diffuse. Leaves 2-3 cm. l.; leaflets ciliate, glabrous on upper surface, with a few adpressed hairs beneath, '8-1'2 cm. l., 4-6 mm. br. Inflorescence laxly paniculate, several-flowered. Flowers about 7 mm. l. Pod 1-4-jointed, contracted between the joints; joints semicircular-roundish, 3-4 mm. in diam.

Miller states in his Gardener's Dictionary that "This grows naturally in Jamaica, from whence the seeds were sent me." A specimen with the name in his own handwriting and marked "Jamaica, 1730, Houstoun," is in Herb. Mus. Brit. But we have not seen any other specimen collected

in Jamaica.

8. STYLOSANTHES Sw.

Leaves pinnately 3-foliolate. Stipules united to the leaf-stalk. Inflorescence terminal or axillary, forming dense heads or spikes; flowers subsessile at the axil of a leaf or of a 2-lobed bract, sometimes solitary with 2 or 3 bracteoles, sometimes with a bristle-like abortive axis. Calyx-tube long, stalk-like; 4 upper lobes united, lowest distinct, narrow, or, the 2 upper lobes united nearly to the apex, the remaining 3 distinct (in S. hamata). Standard roundish. Stamens 10, all united into a closed sheath; anthers alternately longer, subbasifixed, and short, versatile. Pod compressed, apex with a hooked beak, the persistent lower part of the style; joints 2, or 1 (with the lower abortive).

Species 25 to 30, natives of Asia, Africa, N. America, West

Indies, but chiefly of S. America.

Not viscous; leaflets lanceolate; beak of pod as long as joint 1. S. hamata. Viscous-pubescent; leaflets elliptical; beak very short...... 2. S. viscosa.

1. S. hamata Taub. in Verh. Bot. Brand. xxxii. 22 (1890); pubescent or subglabrous; leaflets lanceolate; beak about as long as the pod.—Urb. Symb. Ant. iv. 288. S. procumbens Sw. Prodr. 108 (1788), in Svensk Vet. Akad. Handl. 1789, 297, t. 11, f. 1 & Fl. Ind. Occ. 1282; Macf. Jam. i. 262; Griseb. Fl. Br. W. Ind. 188. Anonis non spinosa minor &c. D. intortum comb. nov.; stem 3-cornered, angles with hooked hairs; leaflets 3; flowers in long lax racemes, terminal and axillary; upper margin of pod slightly notched; joints 10-3, rhomboid-elliptical, 3-3·5 mm. 1.—D. uncinatum DC. Prodr. ii. 331 (1825); Benth. tom. cit. 96; Griseb. op. cit. 187. D. trigonum DC. tom. cit. 332 (1825); Macf. Jam. i. 269. Hedysarum triphyllum maximum &c. Browne Hist. Jam. 301 (1756). H. intortum Miller Gard. Dict. ed. 8 (1768). H. uncinatum Jacq. Hort. Schenbr. iii. 27, t. 298 (1798). H. trigonum Sw. Prodr. 107 (1788) & Fl. Ind. Occ. 1267. Meibomia uncinata Kuntze tom. cit. 197 (1891). Type in Herb. Mus. Brit. (specimen from Houstoun in Herb. Miller).

In fl. Jan.-April; Lane in Herb. Sloane clxii. 77! Houstoun! Hope River, Browne; Liguanea, Broughton! lower mountains, St. Andrew, Macfadyen; Port Royal Mts., McNab! A. W. Lane! Wilson! Mt. Hybla, Watt! David's Hill, 3000 ft., Harris! Blue Mt. Peak, Hitchcock; Fl. Jam.

6665.—Tropical continental America.

Stem trailing amongst bushes. Leaflets ovate to ovate-lanceolate, pilose with adpressed hairs, and also with short hooked hairs along the nerves on the upper side; petiole 3-cornered; stipules tapering from a broad, triangular, amplexicaul base, ciliate, 8 mm. l.; stipels linear-lanceolate, 4-5 mm. l. Racemes to 3 dm. l. Bracts '6-1 cm. l., deciduous. Pedicels solitary or geminate, 5-1 cm. l. Calyx 4-5 mm. l., glabrous. Corolla rosy-pink or purplish-blue, about 1 cm. l. Pod with small hooked hairs, curved, lower margin indented to or beyond the middle.

4. D. axillare DC. Prodr. ii. 333 (1825); stem prostrate, creeping, rooting at the nodes, pubescent; branches procumbent or ascending; leaflets 3; flowers in long-stalked lax racemes

from the lower axils or from axils at rooting nodes; upper margin of pod slightly notched; joints 2 (or 1), semiorbicular, 7-9 mm. 1.—Benth. tom. cit. 99; Griseb. loc. cit.; Urb. tom. cit. 291. D. oblongifolium DC. tom. cit. 332 (1825). D. radicans Macf. Jam. i. 269 (1837). Hedysarum triphyllum majus repens scapis &c. Browne Hist. Jam. 301. H. axillare Sw. Prodr. 107 (1788) & Fl. Ind. Occ. 1274. Meibomia umbrosa Britton, Torr. Bot. Cl. Bull. xxxvii. 353 (1910). Type in Herb. Mus. Brit.

In fl. summer months after rain; Shakspear! St. Andrew Mts., Macfadyen; Distin! Wullschlaegel; March; Moneague, Prior! Claverty Cottage, J.P. 1430, Hart! Scott's Hall, 600 ft.; Castleton Hill, 1000 ft.; Thompson! Hope grounds; Bethlehem St. Elizabeth; T. Harris! Bog Walk, Port Antonio, Hitchcock; Troy, Britton 444; near Newport, Britton 3209. Fl. Jam. 6750, 8029, 8290.—West Indies, Costa Rica, Venczuela, Colombia, Guiana, Brazil, Peru, Chile.

Stem 1-13 ft. Leaflets elliptical, lanceolate, rhomboid or roundish, generally glabrate on upper surface, sometimes puberulous on central nerve, pubescent and markedly net-veined beneath, 3-8 cm. l.; stipules as in D. intortum. Racemes 3-4 dm. l. Bracts very caducous, 4 mm. l. Calyx 2 mm. l. Corolla about 4 mm. l., purple-crimson; standard with two yellow spots near the base. Pod puberulous with minute hooked

hairs, lower margin indented nearly to upper margin.

Meibomia umbrosa Britton appears to be identical with var. acutifolium Urb., but an examination of a series of specimens shows that the characters given as diagnostic, namely, acute leaflets and villose stem, are not constant.

[D. cajanifolium DC. Prodr. ii. 331 (1825); erect puberulous shrub; leaflets 3; flowers in many-flowered panicles; upper margin of pod slightly notched; joints 6 (8-5) roundish-elliptical, 4-6 mm. l.—Benth. tom. cit. 100; Griseb. loc. cit. Hedysarum cajanifolium H. B. & K. Nov. Gen. & Sp. vi. 525, t. 598 (1824). Meibomia cajanifolia Kuntze tom. cit. 195 (1891).

Wilson!-St. Vincent, Trinidad, Central America, Colombia, Guiana, Bolivia, Peru. Grisebach says, "naturalized in Jamaica," but we have seen no specimen except Wilson's.

Shrub 8-10 ft. high. Leaftets oblong, narrowly elliptical to ovate, glaucous-pubescent beneath, 3-9 cm. l. Calyx 3 mm. l. Corolla blue, 8-9 mm. l. Pod straight or slightly curved, puberulous, lower margin indented nearly to upper margin.]

[D. gangeticum DC. Prodr. ii. 327 (1825); stem suberect; leaflet 1; flowers in lax racemes, sometimes paniculate; upper margin of pod slightly notched; joints 8-5, almost orbicular, 2 mm. l.—Wight Ic. t. 271; Griseb. loc. cit.; Bak. in Hook. f. Fl. Br. Ind. ii. 168. Hedysarum gangeticum L. Sp. Pl. 746 (1753). Meibomia gangetica Kuntze tom. cit. 196 (1891). Type in Herb. Linn.

Naturalized; Wilson! Hope grounds, Harris! Bath, Harris & Britton! Fl. Jam. 6775, 8126, 10,568, 12,137.—India, Malay isles, Philippines, China, tropical Africa.

Stem suberect, 1-4 ft. high, woody, pubescent. Leaflet elliptical,

glabrescent on the upper surface, 2–9(–15) cm. l. Calyx 1·5 mm. l. Corolla 3-4 mm. l., white. Pod curved, lower margin indented beyond the middle.

5. D. purpureum comb. nov. (non Hook. & Arn.); stem erect, more or less hispid with long hairs and short hooked hairs; leaflets 3; stipules semicordate, acuminate; flowers in lax terminal and axillary racemes or panicles; pod twisted, indented equally from both margins; joints 6-2, net-veined, about 4 mm. l.—D. tortuosum DC. Prodr. ii. 332 (1825); Macf. Jam. i. 266; Griseb. op. cit. 188; Urb. tom. cit. 293. Hedysarum triphyllum fruticosum, flore &c. Sloane Cat. 73 & Hist. i. 184, t. 116, f. 2. H. caulescens &c. Browne Hist. Jam. 301. H. purpureum Miller Gard. Dict. ed. 8 (1768). H. tortuosum Sw. Prodr. 107 (1788) & Fl. Ind. Occ. 1271. Meibomia purpurea Vail in Small Fl. S. E. U. States 639 (1903). Miller's specimen from Vera Cruz from Houstoun, on which he founded the species, is in Herb. Mus. Brit.

Common; in fl. after rains in May and Oct.; Sloane Herb. iii. 86! Houstoun; Macfadyen! Liguanea, St. Andrew, McNab! Wullschlaegel; Liguanea plain, Campbell! Plato road, 3500 ft.; Hope grounds; Harris! Ward's Rock, 700 ft.; Devon Pen, 300 ft.; Thompson! Fl. Jam, 5992, 6668, 6857, 7921, 7963, 803.—Florida, West Indies as far south as Grenada, Central America, northern South America.

Stem 2-4 ft. high. Leaflets ovate-lanceolate, or narrowly elliptical, hispid, densely along the margins and sparingly on both surfaces and the nerves, 2-11 cm. 1. Pedicels 2 or 3 together, much longer than the flowers, 1-1·5 cm. 1. Calyx about 3 mm. 1. Corolla of a pale azure or purplish colour, about 4 mm. 1. Pod about 2 (1·5-2·3) cm. 1., puberulous with

minuté hooked hairs.

6. D. procumbens Hitchcock in Rep. Miss. Bot. Gard. iv. 76 (1893); stem procumbent and rooting at the base, then ascending, puberulous or glabrate, branches diffuse; leaflets 3 (rarely 1); stipules broad at the base, setaceous; flowers in long lax slender terminal racemes or panicles; pod twisted permanently, indented equally from both margins; joints 8-2, orbicular to rhomboid, net-veined, about 4 mm. l.—D. spirale DC. Prodr. ii. 332 (1825); Benth. tom. cit. 105; Macf. Jam. i. 271; Griseb. loc. cit.; Urb. loc. cit. Hedysarum procumbens, Miller loc. cit. (1768). H. spirale Sw. Prodr. 107 (1788) & Fl. Ind. Occ. 1273. Meibomia spiralis Kuntze tom. cit. 197 (1891). Type in Herb. Mus. Brit.

In fl. towards the end of the year; Lane in Herb. Sloane clxii. 771 Houstoun! Wright! Masson! Macfadyen! Distin! Kingston, Prior! Hope grounds, Harris! Kingston, Lucea Hitchcock; Fl. Jam. 6637, 6964, 11,852.—West Indies, tropical continental America, tropical Africa, East Indies, Pacific Islands.

Stem 1-4 ft. in length. slender, spreading on the ground, or supported by shrubs. Leaflets variable, ovate, lanceolate, oblong, or elliptical, minutely hispidulous or glabrous, 1-3(-6) cm. l., sometimes with a light-greyish streak down the centre. Racemes or panicles 1-2.5 dm. l.

Pedicels 2 or 3 together, ·7-1 cm. l. Flowers very small, rosy or greenish-white tinged with purple. Calyx 1·5(-2·5) mm.l. Corolla about 3 mm.l. Pod 1-1·5 cm. l., puberulous with minute hooked hairs.

7. D. scorpiurus Desv. Journ. Bot. i. 122 (1813); stem very long, procumbent, rooting near the base, angular, pubescent; leaflets 3; stipules semicordate, acuminate; flowers in lax racemes opposite a leaf or axillary; pod indented slightly equally from both margins; joints 7-4, net-veined, linear-oblong, more than twice as long as broad, 4-5 mm. l.—DC. Prodr. ii. 333; Macf. Jam. i. 271; Griseb. loc. cit.; Urb. tom. cit. 293. Hedysarum triphyllum hirsutum &c. Browne Hist. Jam. 301. H. scorpiurus Sw. Prodr. 107 (1788) & Fl. Ind. Occ. 1269. Meibomia scorpiurus Kuntze tom. cit. 198 (1891).

Common in pastures and by roadsides; in fl. Oct.-Jan.; Sloane Herb. iii. 86*! Guys Hill, Browne; Bancroft! St. Andrew, Mts., Macfadyen; Distin! Golden Spring, 800 ft., Thompson! Port Antonio, Lucea, Hitchcock; Hope Gardens, Harris! Fl. Jam. 8064, 11,854.—West Indies, Mexico to Peru.

Stems to 5 dm. and more. Leaflets roundish-elliptical or oblong-elliptical, pubescent or glabrate on the upper surface, more or less pubescent and glaucous beneath, 1-3(-5) cm. l. Racemes '5-1'5 dm. l. Calyx 2'5-3 mm. l. Corolla pale rosy or whitish tinged with purple, 4'5 mm. l.

Pod puberulous with minute hooked hairs.

8. D. molle DC. Prodr. ii. 332 (1825); stem erect, velvety-pubescent with some hairs hooked; leaflets 3; stipules semi-cordate, acuminate; flowers in terminal and axillary racemes or panicles; pod twisted, net-veined, of 2 joints only, the terminal one fertile, the other sterile (occasionally both sterile); fertile joint orbicular or elliptical, emarginate on one side, 6-7 mm. l.—Macf. Jam. i. 267; Benth. tom. cit. 104; Griseb. loc. cit.; Urb. tom. cit. 292. Hedysarum molle Vahl Symb. ii. 83 (1791). Meibomia mollis Kuntze tom. cit. 198 (1891).

"In fl. end of year; common weed in the cane pieces of Guanaboa, St. John." *Macfadyen.*—Hispaniola, Mona, Porto Rico, St. Thomas, St. Cruz, Martinique, Curaçao, Central America, Colombia, Brazil, Guiana.

We have not seen any specimen from Jamaica.

Stem somewhat shrubby, 2-3 ft. high or more. Leaflets ovate, ovate-triangular to lanceolate, soft and velvety to the touch on both sides with minute adpressed hairs, ciliate, 2-8 cm. 1. Racenes or particles 1-3 dm. 1. Pedicels generally 3 together, longer than the flowers, 5-7 cm. 1. Flowers very small, purplish. Calyx about 2 mm. 1. Corolla about 3 mm. 1. Pod puberulous.

[D. gyrans DC. Prodr. ii. 326 (1825); leaflets 3; lateral very small in comparison with the terminal leaflet and moving by jerks (sometimes wanting); upper margin of pod continuous, lower indented, indistinctly 6-10-jointed, dehiscing in a continuous line along the lower margin.—Wight Ic. t. 294; Bak.

tom, cit. 174. Hedysarum gyrans Linn, f. Suppl. 332 (1781). Meibomia gyrans Kuntze tom. cit. 196 (1891).

Naturalized; Mt. James, 1000 ft.; Plato Road, 3500 ft.; Temple Hall, St. Andrew, 600 ft.; Harris! Castleton Road, 600 ft., Thompson! Fl. Jam. 5811, 6644, 8078, 12,133. Native of East Indies, Malay isles, Philippines. Herbaceous or shrubby, 1-4 ft. high; branches subterete. Leaflets 1-3, oblong-lanceolate; terminal leaflet, 5-7 cm. l., sometimes longer; lateral leaflets 1 to nearly 2 cm. l. Racemes and panicles axillary and terminal. Flowers hidden at first by the large ovate deciduous bracts. Calyx 2 mm. l. Corolla about 6 mm. l., yellow; standard veined with violet. Pod 2·5-4 cm. l., curved, puberulous or glabrescent.]

9. D. triflorum DC. Prodr. ii. 334 (1825); stem much branched, prostrate or creeping, slender, more or less pubescent; leaflets 3, small, obovate or obcordate, 4-8 mm. l.; flowers in clusters of 2-4, opposite a leaf; upper margin of pod continuous; joints 3-6, somewhat square, net-veined, tardily dehiscent, 3-3·5 mm. 1.—Benth. tom. cit. 95, t. 26, f. I.; Macf. Jam. i. 272; Wight Ic. t. 292; Griseb. op. cit. 186; Urb. tom. cit. 289. Hedysarum triflorum L. Sp. Pl. 749 (1753); Sw. Obs. 288, t. 6, f. 1. Meibomia triffora Kuntze tom. cit. 197 (1891). Type in Herb. Hermann in Herb. Mus. Brit.

By roadsides, in pastures and in cane-piece intervals; in fl. Nov.; Morant Bay, Broughton! Macfadyen! Prior; Hope grounds, Fawcett! also Harris! Golden Spring, Thompson! Constant Spring, Port Antonio, Lucea, Hitchcock; in pastures, Tyre, near Troy, 2000 ft.; Harris! Fl. Jam. 6798, 7473, 8052, 9084.—Florida, West Indies, tropical continental America, tropical Africa, south-east Asia.

Stipules persistent. Calyx pilose, 2-3 mm. l., segments lanceolate, the two upper united to the middle. Corolla red to purple; standard longclawed, 4 mm. 1. Uppermost stamen free or united only at the base. Pod

1-1.5 cm. l., lower margin indented.

10. **D.** barbatum Benth. in Miq. Pl. Jungh. 224 (1852); stem erect or procumbent with ascending branches, pubescent or villose; leaflets 3; flowers nodding, crowded in dense corymbose terminal racemes, 2 under each large scarious bract, with hirsute calyx; pod reflexed, upper margin continuous; joints 2-4, somewhat rhomboidal, transversely veined, tardily dehiscent, 3 mm. l.— Benth. loc. cit. 95, t. 26, f. II.; Griseb. loc. cit.; Urb. tom. cit. 290. Hedysarum barbatum L. Syst. ed. 10, 1170 (1759), Amæn. v. 403 & Sp. Pl. ed. 2, 1055; Sw. Obs. Bot. 287. H. villosum Miller Gard. Dict. ed. 8 (1768). Nicolsonia barbata DC. Prodr. ii. 325 (1825); Macf. Jam. i. 264. Meibomia barbata Kuntze tom. cit. 195 (1891).

Clarendon Mts., Broughton! Macfadyen; St. Ann, Purdie! Wilson! Westphalia, J.P. 1477, Campbell! St. George, 2500 ft.; Mt. Hybla, 3500 ft.; Savanna, Upper Clarendon, 2500 ft.; Harris! Spanish River, seven miles from Buff Bay, Moore!—West Indies, tropical continental America.

Plant low-growing to 2 ft. Leaflets, terminal oblong-elliptical,

1·3-3 cm. l., lateral a little smaller; stipules persistent. Racemes 1·5-3 cm. l. Bracts hirsute. Calyx 4 mm. l. Corolla shorter than the

39

calyx, rosy, blue or whitish; standard long-clawed. Uppermost stamen free or cohering only at the base. Pod '7-1'3 cm. 1., lower margin indented.

D. umbellatum DC. Prodr. ii. 325 (1825); shrub with terete branches; leaflets 3; flowers in dense shortly-stalked or sessile axillary umbels; pod with style persistent, upper margin slightly notched; joints 5-1, elliptical, 7-10 mm. 1.—Bak. tom. cit. 161. Hedysarum umbellatum L. Sp. Pl. 747 (1753); Jacq. Hort. Dendrolobium umbellatum Benth. in Mig. Pl. Schoenbr. t. 297. Jungh. 218 (1852); Griseb. op. cit. 188. Meibomia umbellata Kuntze tom. cit. 197 (1891). Type in Herb. Hermann in Herb. Mus. Brit.

March!-Native of East Indies, Mascarene isles, Malaya, Philippines, Polynesia.

Shrub 5-6 ft. high, rather showy; branches, when young, densely downy. Leaflets elliptical to roundish, 5-8 cm. l. Calyx 4-5 mm. l. Corolla 1-1·2 cm. l. Pod 4-5 cm. l., lower margin indented to the middle, silky or glabrescent. Naturalized according to Grisebach, but we have not seen any specimen from Jamaica, except March's in Herb, Kew.]

[D. Cephalotes Wall. Cat. n. 5721 (nomen); Wight & Arn. *Prodr.* 224 (1834); shrub with 3-angled villose branches; leaflets 3; flowers in dense shortly stalked axillary umbels; pod shortly beaked, upper margin slightly notched; joints 2-5, somewhat square or elliptical, 4 mm. 1.— Wight Ic. t. 373; Bak. tom. cit. 161. Hedysarum Cephalotes Roxb, Fl. Ind. iii. 360 (1832). Meibomia Cephalotes Kuntze tom. cit. 195 (1891).

Introduced; above Gordon Town, 1200 ft., Harris! Fl. Jam. 7889.—

East Indies, Malaya, Siam, China.

A straggling shrub, 3 to 4 ft. high. Leaflets narrowly elliptical to lanceolate, subacuminate, 5-12 cm. l. Calyx 4-4.5 mm. l. Corolla deep red, 7-8 mm. l. Pod ·8-1·5 cm. l., silky or glabrescent.

[D. triquetrum DC. Prodr. ii. 326 (1825); leaflet single; petiole winged.—Bak. tom. cit. 163. Hedysarum triquetrum L. Sp. Pl. 746 (1753). Meibomia triquetra Kuntze tom. cit. 197 (1891). Type in Herb. Hermann in Herb. Mus. Brit.

In fl. at end of year; naturalized; Mt. Airy, 3000 ft.; between Mt. Airy and Brandon Hill, 1000 ft. (growing on trees); Harris! Prospect Hill, 2000 ft.; Thompson! Fl. Jam. 6373, 7460, 7957.—Native of East Indies,

China, Philippines.

Shrub 3-4 ft. high; branches more or less triquetrous. Leaflets lanceolate or ovate, '5-2 dm. l. Racemes terminal and axillary, 1'5-3 dm. l. Flowers pink. Calyx 3 mm. l. Corolla about 5 mm. l. Pod thin, indehiscent, splitting into joints, 2'5-3 cm. l., 5-7 mm. br.; joints 6-8, nearly square.

[LOUREA Neck.

Leaves 3-foliolate (reduced usually to a single 2-lobed leaflet in L. vespertilionis Desv.). Racemes terminal. Calyx 5-fid, at length inflated. Standard obcordate; narrowed into a claw. Uppermost stamen free, the rest united. Pod constricted between the seeds; joints 4–5, compressed, folded back on each other, and hidden within the enlarged calyx.

Species 4, growing within the tropics in Asia and Australia.

L. vespertilionis Desv. Journ. Bot. i. 122, t. 5, f. 18 (1813); Wight Ic. t. 285. Hedysarum vespertilionis Linn. f. Suppl. 331 (1781); Lour. Fl. Coch. 447; Jacq. Ic. Pl. Rar. iii. t. 566; Griseb. Fl. Br. W. Ind. 185; Bak. in Hook. f. Fl. Br. Ind. ii. 154. Founded by Linnæus fil. on a specimen sent by Father Joannes de Loureyro from Cochin China in 1774. There is a specimen from Loureyro of the same date in Herb. Banks in Herb. Mus. Brit.

Naturalized; in fl. May-Sept.; "near Botanic Gardens, Port Royal Mts." (collector not named, in Herb. Kew.); Purdie! Providence Road, 700 ft.; Temple Hall, 800 ft.; Thompson! Constant Spring, Hitchcock; Castleton District, 500 ft.; Mona, 800 ft.; Constant Spring to Bardowie, 800 ft.; Harris! Fl. Jam. 6744, 7402, 8008, 8941, 12,108.—Naturalized in St. Kitts, Martinique, St. Vincent, Trinidad, native of East Indies.

Stem 2-3 ft. high, erect, slender. Leaves thin, somewhat leathery, generally 1-foliolate, rarely 3-foliolate; leaflet with 2 narrowly lanceolate blunt spreading 2-3-nerved halves, 3-8 cm. in breadth from tip to tip, ·5-1·5 cm. l.; lateral leaflets, if present, much smaller, obliquely obversely deltoid. Calyx finally 6-9 mm. l. Corolla a little longer than the calyx, vellow or white. Pod. joints 3 mm. l.]

[ALYSICARPUS Neck.

Leaves 1-foliolate. Stipules dry, enclosing 2 stipels. Flowers small, in terminal, and sometimes also in axillary, racemes. Calyx 5-fid, segments long, narrow, dry, rigid. Corolla included. Standard obovate or roundish, clawed. Uppermost stamen free, the rest united. Pod cylindrical or only slightly compressed; joints several, thick.

Species 16, growing within the tropics in Asia, Africa, and

Australia, one also naturalized in tropical America.

A. vaginalis *DC. Prodr. ii.* 353 (1825); *Griseb. Fl. Br. W. Ind.* 185; *Bak. in Hook. f. Fl. Br. Ind. ii.* 158. A. nummularifolius *DC. loc. cit.*; *Urb. Symb. Ant. iv.* 294. Hedysarum foliis simplicibus cordato-oblongis, petiolis simplicibus, stipulis vaginantibus *L. Fl. Zeyl.* 133. H. vaginale *L. Sp. Pl.* 746 (1753). Type in Herb. Hermann in Herb. Mus. Brit. As pointed out by Trimen in Flora of Ceylon (ii. 44) *Hedysarum nummularifolium L.* (Sp. Pl. 746) has been generally regarded as a synonym of this species, but the description, as well as the type

in Hermann's Herb., show it to be Indigofera echinata Willd. This has been overlooked by Urban in Symb. Ant., where the above species is cited as A. nummularifolius.

In fl. Oct.-March; coast of Trelawney, Purdie! Hope grounds; King's House grounds; Cokely, near Castleton, 600 ft.; Harris! Golden Valley, 500 ft.; Thompson! Constant Spring, Bog Walk, Port Morant, Hitchcock; Fl. Jam. 6808, 6954, 8050, 12,159.—Naturalized in West Indies and Guiana; native in tropics of Old World.

Stems creeping, with ascending branches 1-3 ft. l. Leaflets of different forms often on the same plant, generally elliptical or round, sometimes oblong or lanceolate, base cordate, 3 mm.-4 cm. l. Racemes with 6-12 flowers, generally crowded. Calyx 5 mm. l. Corolla rosy or pale purple. Pod wrinkled, 1-2 cm. l.; joints 5-7, 2-2·5 mm. l. Seeds about 1 mm. l.]

§ 5. Low-growing herbs. Leaves abruptly pinnate, without stipels. Flowers, 1, or more, crowded in the lower axils. Stamens 10 (or 9), all united into a closed sheath. Pod burying itself in the earth, not splitting open.

[ARACHIS L.

Leaves with 2 pairs of leaflets. Stipules adherent to the leaf-stalk. Calyx, tube very long, stalk-like, 4 upper lobes united, lowest distinct, narrow. Standard roundish. Anthers alternately long, subbasifixed and short, versatile. Pod somewhat constricted between the seeds, but not jointed, continuous within. Seeds 1-3.

Species 9, of which 8 are Brazilian, and 1 (A. hypogæa) of uncertain origin, cultivated throughout the tropics.

A. hypogæa L. Sp. Pl. 741 (1753); Wright Mem. 189; Macf. Jam. i. 322; Benth. in Fl. Bras. xv. pt. 1, 86, t. 23, f. 1; Griseb. Fl. Br. W. Ind. 189; Bentl. & Trim. Med. Pl. t. 75; Urb. Symb. Ant. iv. 289. Arachidna indiæ &c. Sloane Cat. 72 & Hist, i. 184. Sena tetraphylla &c. Pluk. Phyt. t. 60, f. 2 & Alm. 341.

Ground Nut, Earth Nut, Pea Nut, Monkey Nut. Cult. Sloane Herb. iii. 85! Wright! Macfadyen.—Cultivated in the

tropics, probably native of Brazil.

Annual, with spreading hairs on branches and petioles. Stem thick, erect, often 1 ft. high; branches shortly prostrate then ascending. Leaflets obovate or broadly oblong, apex rounded with a minute mucro, ciliate with a few hairs, glabrous on upper surface, pubescent or glabrescent beneath, 2·5-5 cm. 1.; petiole 5-7 cm. 1. Calyx: tube 2-4 cm. 1., limb about ·5 cm. 1. Corolla golden yellow; standard about 1 cm. 1. Pod (an inch or more below the ground) at the end of a stiff stalk, 5-7 cm. l., which has grown beneath the ovary after the fall of the flower, 2-4 cm. l. Seeds edible, rich in oil.]

[§ 6. Climbing herbs. Leaves abruptly pinnate ending in a tendril; leaflets without stipels. Stipules semisagittate. Flowers subsessile, 1 or 2 together in the axils. Stamens 10, uppermost free or more or less united with the sheath. Pod 2-valved.

VICIA L.

Leaflets in several pairs. Calyx with 5 segments. Standard obovate, emarginate with a broad claw. Mouth of the staminal sheath oblique. Style thread-like, with a bunch of hairs at the apex. Pod compressed, continuous within. Seeds globular, with a small aril.

Species 120, widely dispersed through the temperate regions of the northern hemisphere and of South America.

V. sativa L. Sp. Pl. 736 (1753); Macf. Jam. i. 272; Griseb. Fl. Br. W. Ind. 189. Type in Herb. Linn.

Vatab

Naturalized; Macfadyen; March! Clifton Mount; Mt. Hybla, 3600 ft.; Harris! Fl. Jam. 10,802.—Native of Europe, widely cultivated and natural-

ized throughout the world.

Annual. Leaflets in 5-7 pairs, oblong-linear, apex truncate, mucronate. Flowers dark rose or purple, with very short stalks, 1-2 in the axils. Calyx-segments equal, about as long as the tube, lanceolate, acuminate. Corolla about 2 cm. 1. Pod glabrate, linear, about 5 cm. 1.

Lathyrus tingitanus L., the Tangier Pea, has been collected in the Blue Mts., but it is probably an escape from a garden. It is an annual with a winged stem, a single pair of leaflets with a branched tendril, and flowers purple, about an inch long, 2 or 3 in a raceme.]

§ 7. Shrubs with twining branches. Leaves abruptly pinnate, with the end of the petiole produced bristle-like; leaflets without stipels. Flowers in clusters along axillary and terminal racemes. Stamens 9, united into a sheath split above. Pod 2-valved.

11. ABRUS Adans.

Leaflets in numerous pairs. Calyx truncate, teeth very short. Standard elliptical-ovate, with a short broad claw. Style glabrous. Pod compressed, with transverse membranous partitions between the seeds.

Species 6, natives of the tropics.

west, near Kingston, Harris! Constant Spring, Port Morant, Lucea, Hitchcock; Hope grounds; Halfway Tree; Miss Wood!—Tropics.

A climbing shrub; branches many, twining. Leaves 6-13 cm. 1.; leaflets in 10-20 pairs, lingulate-oblong, deciduous, 1-2 cm. 1. Racemes short, crowded, many-flowered. Calyx 2-4 mm. l. Corolla flesh-coloured, ·9-1·2 cm. l. Pod oblong, somewhat rectangular, 3-5-seeded, to 4 cm. l. Seeds bright scarlet with a black spot (or black, or whitish or mixed black

The roots are used as a substitute for liquorice. The leaves have a sweet taste, and are made into tea for coughs and pleurisies (Wright). The seeds are principally employed, strung like beads, to form necklaces and rosaries; and it is, from their being employed for the latter purpose, that the plant has received its specific designation (Macfadyen). They are used by goldsmiths in India as weights.

§ 8. Herbs or shrubs, twining, or sometimes erect, rarely prostrate, or becoming trees in *Erythrina*. Leaves pinnately 3-foliolate (5-7-foliolate in *Clitoria Ternatea*); leaflets with stipels. Flowers in axillary racemes, often 2 or more in clusters along the rhachis of the raceme, peduncles 1-3-flowered in *Clitoria*, flowers often 1-few in axils in *Teramnus* and *Galactia uniflora*. Stamens 10, all united into a sheath or the uppermost more or less free. Pod 2-valved.

12. CENTROSEMA Benth.

Stem climbing with twining branches (in W. Indian species). Leaves 3-foliolate (in Jamaican species), sometimes reduced to one leaflet. Peduncles axillary, solitary or geminate, with one to numerous flowers. Bracteoles adpressed to the calyx, longer than the calyx or nearly as long. Calyx campanulate or funnel-shaped; segments very short, or longer than the tube, or only the lowest longer than the tube. Standard large, broadly roundish, flattened, spurred or slightly gibbous above the short claw. Style dilated at the apex. Pod flat-compressed, with a long beak, and partitions between the seeds; valves ribbed near both margins.

Species 30, natives of the West Indies and Central and S. America, one (C. virginianum) also in southern N. America

and naturalized in Java.

Leaves broadly ovate. Bracteoles 2 or 3 times as long as the calyx. Pod nearly 1 cm. in diam.; ribs

3 mm. from margin 1. C. Plumierii.

Leaves narrowly ovate or oblong. Bracteoles equal to, or shorter than, the calyx. Pod 4-6 mm. in diam.; ribs close to the margin.

Leaflets soft and velvety. Calyx-segments

linear-lanceolate 3. C. virginianum.

1. C. Plumierii Benth. Comm. Legum. Gen. 54 (1837); leaflets large, broadly ovate or elliptical, glabrous, 6-12 cm. l.; bracteoles 2 or 3 times as long as the calyx; segments of calyx unequal, short, uppermost very short or obsolete; standard 4-5·5 cm. br.; pod nearly 1 cm. in diam., with ribs about 3 mm. from the margin.—Benth. in Ann. Wien. Mus. ii. 118 & in Fl. Bras. xv. pt. 1, 127; Griseb. Fl. Br. W. Ind. 192; Urb. Symb. Ant. iv. 300. Phaseolus amplo flore peltato &c. Plum. Descr. Pl. Amer. t. 108 & Ic. ined. iv. t. 238. Clitoria Plumieri Turp. ex Pers. Sym. ii. 303 (1807); Bot. Reg. t. 268; Rev. J. Lindsay Ic. ined.; Macf. Jam. i. 253.

Fee-fee.

In fl. and fr. Oct.—Jan.; Sloane Herb. iii. 73 (pods only)! Barham in Herb. Sloane clxii. 269! Houstown! common in Wythiwood, Lindsay; Broughton! Distin; Purdie; Wullschlaegel; Wilson; Bog Walk, Port Morant, Lucea, Hitchcock; Hope; near Castleton; Harris!—West Indies, tropical continental America.

Peduncles few (2-6)-flowered, 3-7 cm. l. Bractcoles ovate-elliptical, about 1.5 cm. l. Calyx about .5 cm. l. Corolla, standard sparsely puberulous outside, white stained with crimson and deep bright purple; wings white, stained with purple towards the apex. Pod 12-15 cm. l.

2. C. pubescens Benth. Comm. Legum. Gen. 55 (1837); leaflets elliptical or oblong, apex often very shortly acuminate,

Gen. Pl. i. 164 (1891). The type, Clayton's specimen in Herb. Gronovius, is in Herb. Mus. Brit.

In fl. and fr. Oct.-Feb.; Sloane Herb. iii. 73, 74! Lane in Herb. Sloane clxii. 80! De Ponthieu! Distin! Cuming! Pedro plain, Purdie! Gordon Town, Ball! Constant Spring, Campbell! also Hitchcock; Porus, Lloyd; above Gordon Town, 1000 ft.; Hope grounds, 700 ft.; Harris!—Bermuda, Bahamas, West Indies, continental America from the southern

United States to Argentina, western tropical Africa.

Peduncles solitary or 2-3 together, 3-1-flowered, 1-2·5(-5) cm. 1.

Bracteoles ovate, '6-1 cm. 1. Flowers lavender-blue or white turning pale blue. Calyx '8-1·2 cm. 1.; tube short, about 2 mm. 1.; teeth '6-1 cm. 1.

Standard spurred, sparsely puberulous outside. Pod 8-12 cm. 1.

13. CLITORIA L.

Herbs or shrubs with twining stems (in Jamaican species). Bracteoles large, ribbed, persistent, less than half as long as the calyx. Calyx campanulate-tubular, with 5 segments or teeth. Standard large, emarginate-roundish at the apex, narrowed at the base. Style more or less horizontally dilated at the apex, and with a row of hairs on the inner face. Pod compressed, without ribs (C. Ternatea), or with a rib near the middle (C. rubiginosa).

Species 30, natives of the tropics.

Leaflets 5-7. Flowers blue...... 1. C. Ternatea. Leaflets 3. Flowers white, streaked...... 2. C. rubiginosa.

1. C. Ternatea L. Sp. Pl. 753 (1753); leaflets in 2-3 (4-5) pairs; pod without ribs.—Bot. Mag. t. 1542; Benth. in Journ. Proc. Linn. Soc. ii. 33 & in Fl. Bras. xv. pt. 1, 118, t. 31, f. I.; Griseb. Fl. Br. W. Ind. 192; Urb. Symb. Ant. iv. 299. (Fig. 13.) Type in Herb. Linn. and in Herb. Hermann in Herb. Mus. Brit.

Canefields, St. Andrew, McNab! Hope Gardens; near Runaway Bay; Harris! Halfway Tree, Miss Wood! Fl. Jam. 10,370; Kingston, Hitchcock. -Florida (naturalized), Bahamas, West Indies, Panama, tropical eastern

S. America, tropical Africa.

Stem twining, puberulous. Leaflets elliptical or ovate, glabrous, 2–5 cm. l. Peduncles one-flowered, very short, 3–8 mm. l. Bracteoles roundish, less than half as long as the calyx, 6–8 mm. l. Flowers blue, rarely white. Calyx 1·5–2 cm. l. Standard 4–5 cm. l. Pod, valves flat

or slightly convex, beaked, pubescent, 6-11 cm. l. Seeds roundish-ellipsoidal, compressed, smooth. In cultivation the flower often becomes double.

The powdered seeds (30 to 60 grains) are purgative and aperient, and have gained a certain reputation in Europe as a safe medicine, especially for children (Watt). Species of Clitoria have been used as cover crops to protect the soil from wash on sloping ground.

2. C. rubiginosa Juss. ex Pers. Syn. ii. 303 (1807); leaflets 3; pod with a rib near the middle.—Urb. loc. cit. C. glycinoides DC. Prodr. ii. 234 (1825); Macf. Jam. i. 253; Griseb. loc. cit.; Benth, in Journ. Proc. Linn. Soc. ii. 39 & in Fl. Bras. loc. cit.

In fl. May-Oct.; Wright! Savanna la Mar, Distin! Guys Hill, St. Thomas in the Vale, McNab! also Purdie; road to Dolphin Peak, 1000 ft.; Oxford, near Troy, 1400 ft.; Kellits, Clarendon, 2000 ft.; Harris! Fl. Jam.

9261, 9429, 11,153.—West Indies, Panama, tropical S. America.

Stem twining, villose-pubescent. Leaflets elliptical to oblong; beneath lighter-coloured and more or less softly silky-pubescent, 4-9 cm. 1. Peduncles 1-3-flowered, 3-9 cm. 1. Bractcoles elliptical, acute, less than half as long as the calyx, 8-9 mm. 1. Flowers white, standard with lilac, rose, or crimson streaks in the centre, very fragrant. Calyx 2-3 cm. 1. Standard 4-5 cm. l. Pod, valves convex, glabrous, 3.5-4 cm. l. Seeds somewhat globose, with a network of transparent dried mucilage.

14. TERAMNUS Sw.

Twining slender shrubby herbs. Inflorescence often of two forms on the same plant; flowers very small, a few in clusters in the axils, or 2 or more in clusters along the rhachis of axillary Calyx, segments 5 or 4. Standard obovate, narrowed racemes.

into a long claw. Stamens all united; anthers alternately sterile. Style glabrous. Pod linear, with partitions between the seeds. Species 6, growing in the tropics.

Pod densely villose with a hooked beak. Calyx-

segments 5, longer than the tube...... 1. T. uncinatus.

Pod with scattered hairs and oblique beak. Calyx-segments not longer than the tube.

Leaflets oblong to elliptical-lanceolate. Calyx-

segments 4...... 2. T. volubilis.

Leaflets elliptical, obtuse. Calyx-segments 5... 3. T. labialis.

1. T. uncinatus Sw. Prodr. 105 (1788) (including the synonymy under T. volubilis); calyx-segments 5, equal, linear-lanceolate. longer than the tube; pod with a hooked beak, densely villose.— Sw. Fl. Ind. Occ. 1239; Macf. Jam. i. 274; Benth. in Fl. Bras. xv. pt. 1, 138, t. 37; Griseb. Fl. Br. W. Ind. 193; Urb. Symb. Ant. iv. 301. Phaseolus sylvestris &c. Sloane Cat. 71 & Hist. i. 182. Teramnus triphyllus &c. Browne Hist. Jam. 290. Glycine caule piloso &c. Plnm. Pl. Amer. (Burm.) t. 221. Dolichos uncinatus L. Sp. Pl. ed. 2, 1019 (1763). (Fig. 14.) A specimen from Browne in the Linnean Herbarium is named by Linneus D. uncinatus.

In fl. Oct,-April; Guanaboa, Sloane Herb. iii. 76! Browne! Houstoun! Shakspear! Swartz! Macfadyen! Richmond, St. Mary, McNab! St. Thomas in the Vale, Prior! Bog Walk, Port Morant, Lucea, Hitchcock; Resource, Blue Mts., 3500 ft., Harris! Fl. Jam. 5504, 6612.—Bahamas, Cayman Is., Cuba, Hispaniola, Porto Rico, tropical continental America.

Plant covered with dense silky hairs. Leaflets oblong or lanceolate to elliptical, pubescent with adpressed hairs on the upper surface, densely silky-pubescent beneath, 3-7 cm. l. Calyx about 6 mm. l. Corolla reddishpurple; standard about 6 mm. l.; wings about 5.5 mm. l., with no definite lobe at base of limb; keel 3.5 mm. l. Pod 6-2.5 cm. l., 3 mm. br.

In Swartz's Prodromus the citations from Linnæus, Browne, and Sloane under T. volubilis are shown, by comparison with his "Flora" and his own specimens in Herb. Banks in Herb. Mus. Brit., to belong to his second species, T. uncinatus.

2. T. volubilis Sw. Prodr. 105 (1788) (excluding the synonymy); calyx-segments 4, upper very shortly 2-toothed, triangular, acute, shorter than the tube; pod with scattered adpressed hairs, with an oblique beak.—Sw. Fl. Ind. Occ. 1241; Macf. Jam. i. 275; Benth. tom. cit. 137; Griseb. loc. cit. Glycine oblonga Benth. Bot. Sulph. 84 (1844). Specimen from Swartz in Herb. Mus. Brit.

In fl. Oct., Nov.; Swartz! Macfadyen; Blue Mts., Rothrock; Port Morant, Lucea, Hitchcock; Charlton, near Ewarton, 1000 ft.; Ferry River;

Harris! Fl. Jam. 6695, 11,424.—Tropical South America.

Leaflets oblong or lanceolate to elliptical-lanceolate, glabrate on the upper surface, pubescent with scattered adpressed hairs beneath, 2-7 cm. l. Calyx 3.5-4 mm. l., villose. Corolla violet-rose; standard 5 mm. l.; wings with one broad tooth at junction of claw and limb, 5 mm. l.; keel 3.2 mm. l. Pod 3-3 5 cm. l., 2 mm. br.

3. T. labialis Spreng. Syst. iii. 235 (1826); calyx-segments 5, ovate-lanceolate, a little shorter than the tube; pod with a few scattered hairs or glabrate, with a short oblique beak.—Benth. in Journ. Linn. Soc. viii. 265; Bak. in Hook. f. Fl. Br. Ind. ii. 184. Glycine labialis Linn. f. Suppl. 325 (1781); Wight Ic. t. 168. G. debilis Ait. Hort. Kew. iii. 34 (1789); Jacq. Eclogæ Pl. Rar. t. 166. Koenig's specimen is in Herb. Mus. Brit.

In fl. at the end of the year; Lane in Herb. Sloane clxii. 78! Macfadyen! Black River; Ferry River; Harris! Fl. Jam. 9923, 10,040.—Tropics.

Leaflets elliptical, obtuse, with very few hairs or glabrate on the upper IV.

surface, with scattered adpressed hairs beneath, 1-5.5 cm. l. Calyx about 3.5 mm. l., villose. Corolla "white," turning pink; standard about 4 mm. l.; wings about 3.5 mm. l., with a rounded lobe at junction of claw and limb, and the limb kneed opposite to it; keel about 2.8 mm. l. Pod 3.5-4.5 cm. l., 3.5-4 mm. br., slightly curved, the upper suture forming a narrow wing.

15. ERYTHRINA L.

Trees or erect shrubs, often prickly. Racemes axillary (in Jamaican species). Flowers generally scarlet, 2 or more together along the rhachis, appearing before the leaves. Bracts and bracteoles small or none. Calyx campanulate, truncate or spathaceous. Standard much larger than the wings and keel, which are often included within the calyx. Uppermost stamen free or united at the base with the rest, the others united about, or above, the middle. Pod stalked, constricted or sinuate between the seeds, 2-valved or opening only along the upper margin, or scarcely opening.

Species 30, natives of the tropics.

Glabrous. Standard erect, folded together, broad as long...... 2. E. velutina.

1. E. corallodendrum L. Sp. Pl. 706 (1753); glabrous; calyx tubular; standard oblong, folded together, slightly curved, erect. -Wright Mem. 292; Macf. Jam. i. 297; Benth. in Fl. Bras. xv. pt. 1, 174; Griseb. Fl. Br. W. Ind. 199; Urb. Symb. Ant. iv. 302. Coral arbor non spinosa flore longiore et magis clauso Sloane Cat. 143 & Hist. ii. 38, t. 178, f. 1, 2. Coral arbor americana Commel. Amst. i. 211, t. 108. Erythrina arborea spinosa et non spinosa &c. Browne Hist. Jam. 288. Specimens from Hort. Cliff. and Sloane in Herb. Mus. Brit. Type in Herb. Linn.

Coral Tree, Red Bean Tree. Sloane Herb. vi. 121 Broughton! Macfadyen; J.P. 910, Morris! Mount Faraway, 5000 ft., Harris! Fl. Jam. 7309; Lucea, Hitchcock.—West Indies,

Central and S. America.

Tree 15-20 ft., with or without thick spines here and there on the tree 15-20 ft., with or without thick spines here and there on the stem. Leaflets broadly ovate-rhomboid, 5-10(-15) cm. l. Flowers 2-3 together. Calyx truncate, occasionally shortly split, 1 2 cm. l.; teeth very small or wanting. Corolla deep crimson; standard 4 times as long as the keel, to 7 cm. l., to 2 cm. br.; wings a little longer than the calyx; keel of separate petals, a little shorter than the wings. Stamens shorter than the standard, the uppermost united with the rest at the base. Pod contracted between the seeds, about 1 dm. l.; the lower part stalk-like and apex long-beaked. Seeds scarlet, about 1 cm. l.

2. E. velutina Willd. Sp. Pl. iii. 914; inflorescence, leaves and pods, covered with tomentum, at length deciduous, especially on the upper surface of leaves; calvx spathe-like, tomentose;

standard nearly as broad as long, reflexed.—Rev. J. Lindsay Ic. ined.; Lowe in Bot. Mag. t. 3227; Macf. Jam. i. 298; Benth. tom. cit. 173; Griseb. loc. cit. Coral arbor Sloane Cat. 142 & Hist. ii. 38. (Fig. 15.)

Coral Tree, Red Bean Tree.

Sloane Herb. vi. 11! Wright! Robins! Macfadyen; Savanna la Mar, Purdie! Moneague, Prior! Arcadia, St. Ann, Mrs. Sewell! Gordon Town, J.P. 1314, Hart! Chapelton, Mrs. Craig! between Rose Hill and Temple Hall; Chapelton; Fawcett!—Tropical S. America.

Tree to 30 ft., with short spines on the stem. Leaflets variable in shape, more or less ovate-rhomboid, triangular, or roundish, lateral oblique,

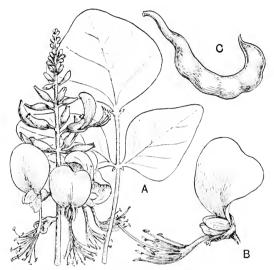

Fig. 15.— $Erythrina\ velutina\$ Willd. A, Leaf and raceme. B, Flower. C, Pod. All \times \\ \frac{1}{2}.

almost always tomentose beneath, 4–9 cm. l. Flower-buds oblong-ellipsoidal, $2\cdot5-3$ cm. l. Flowers 2–3 together. Calyx $1\cdot5-2$ cm. l. Corolla, standard orange-red (almost vermilion), $3\cdot2-6$ cm. l.; wings exserted, chestnut-red with purple-red edge; keel of 2 petals similar in shape and colour to the wings and about the same length. Stamens about 6 cm. l. Pod somewhat contracted between the seeds, about 13 cm. l.; sometimes 1-seeded, 5–8 cm. l., tomentose, the lower part seedless, with a short beak at the apex. Seeds vermilion-red, about $1\cdot5$ cm. l.

16. MUCUNA Adans.

Twining herbs or shrubs. Lateral leaflets unequal-sided. Stipules deciduous. Flowers in racemes which are sometimes subumbellate, large, purple, red or yellowish, occurring singly or in clusters on the rhachis. Calyx shortly campanulate, with

51

4 segments or 4-5 teeth. Standard auricled at the base, shorter than the wings. Uppermost stamen free, the rest united; anthers alternately basifixed and versatile, the latter bearded and with filaments somewhat thickened above. Pod thick, leathery, hairy, often with stinging hairs; the seeds separated by partitions or by tissue; hilum enlarged.

Species 30, growing in the tropics.

Leaflets hairy beneath.

Flowers clustered at end of peduncle.

1. M. urens Fawc. & Rendle in Journ. Bot. lv. 36 (1917) (non DC.); leaflets elliptical, abruptly and shortly acuminate, glabrous on both sides; peduncle about 10 times as long as the petiole, with several flowers, 1, 2 or 3 together in a contracted raceme at the apex; pod with 2 narrow wings only along the upper margin and numerous obliquely transverse ribs.—M. altissima DC. Prodr. ii. 405 (1825); Benth. in Fl. Bras. xv. pt. 1, 170, t. 46, A; Griseb. Fl. Br. W. Ind. 198; Urb. Symb. Ant. iv. 304, v. 372. Phaseolus americanus frutescens &c. Pluk. Phyt. t. 213, f. 2, Alm. 292. Zoophthalmum siliquis &c. Browne Hist. Jam. 295. Dolichos urens L. Syst. ed. 10, 1162 (1759). Clitoria Zoophthalmum L. Syst. ed. 10, 1172 (1759). Dolichos altissimus Jacq. Enum. Pl. Carib. 27 (1760) (excl. syn.) & Sel. Stirp. Amer. 203, t. 182, f. 85 (excl. syn.), Ed. pict. t. 190. Plukenet's specimen is in Herb. Mus. Brit. (Herb. Sloane).

Ox Eye Bean.

Rare; in fl. Sept. and Oct.; Browne; St. Mary, McNab! mountain woods, Manchioneal, Wilson.—West Indies, Panama, Brazil.

Stem climbing high over trees, glabrous. Leaflets 8-16 cm. l., 5-7.5 cm. br.; petioles 5-13 cm. l. Peduncle to 1.5 m. l., slender, pendulous. Flowers blue-purplish with a yellowish keel. Calya, tube 1-1.2 cm. l., truncate, toothed, uppermost tooth emarginate, lateral nearer to the lowest which is the longest, about 4 mm. l. Corolla: standard 3-4 cm. l., adpressed to wings and keel, three-fourths to nearly as long as the wings, very broad; wings with a long claw which is 1-1.5 cm. l. and tomentoes at the edges: keel clightly longer than the wings. tomentose at the edges; keel slightly longer than the wings. Pod 12-23 cm. l., 5 cm. br., hispid with bristly stinging hairs and also pubescent. Seeds about 4, flattened-rounded, almost surrounded by the hilum, 3 cm. in diam., or even larger.

Dolichos urens L. Syst. is based on Browne's description of Zoophthalmum and on Plukenet's figure. Plukenet's specimen in Herb. Sloane has leaves which are glabrous on both sides, and Browne's description states that the peduncle is "seldom under four or five feet in length"; it is therefore clear from these two diagnostic details to which species Linnæus's name, as given in the Systema, belongs. Jacquin in Sel. Stirp. Amer. 202, 3, has given long and careful descriptions of this and a second West Indian species, which he calls respectively *D. altissimus* and *D. urens*, thus applying Linnæus's name to the wrong species. De Candolle followed Jacquin in the misapplication of the name, when transferring the two species to the genus Mucuna. D. urens L. Syst. must therefore be cited as Mucuna urens (non DC.), of which M. altissima DC. is a synonym, and the species known as M. urens DC. must be renamed.

2. M. Sloanei Fawc. & Rendle loc. cit.; leaflets, terminal elliptical, lateral ovate, generally shortly acuminate, densely covered beneath with small adpressed silky hairs; peduncle about as long as the petiole or twice as long, with several flowers in a subumbellate cluster at the apex; pod with 2 narrow wings along each margin and numerous obliquely transverse narrow wings. —M. urens DC. Prodr. ii. 405 (1825) (excl. ref. to Pluk.); Macf.

Horse Eye Bean. In fl. Feb.; Rio Cobre, Guanaboa, Sloane Herb. iii. 69! Lane in Herb. Sloane clxii. 81! Wright! Hope, Broughton! Macfadyen; Wullschlaegel; Prior; Chatsworth, Harris! Fl. Jam. 5590.—West Indies, tropical continental America, tropical west Africa.

Stem climbing over high trees. Leaflets, 7-16 cm. l., 4.5-9 cm. br.; petioles 7-11 cm. l. Pedicels about 1 cm. l. or rather less. Flowers yellow. Calyx: tube about 1 cm. l.; upper segment very broad, entire or shortly 2-toothed; lateral smaller; the lowest longer, about equalling the tube, triangular, acute. Corolla: standard spreading erect, 3-3.5 cm. l., about half as long as the wings; wings 5-5.5 cm. l., claw very short; keel a little longer than the wings. Pod 10-15 cm. l., about 4 cm. br., hispid with bristly hairs and pubescent; wings 2-5 mm. br. Seeds 2-4, compressed-roundish, almost surrounded by the hilum, 2 to nearly 3 cm. in diam.

3. M. Fawcettii Urb. Symb. Ant. v. 371 (1908); leaflets roundish or roundish-elliptical or roundish-ovate, abruptly and shortly acuminate, densely covered beneath with adpressed silky hairs; peduncles about as long as the petioles, expanded at the end into a flattish-convex receptacle (1 cm. br.), from which spring several flowers; pod 1-seeded and obovate-semiorbicular or 2-seeded and oblong-elliptical, with ribs along the margins almost obsolete.

In fl. Nov., Dec.; near Troy, 2000 ft., Harris! Fl. Jam. 8818, 9102. Stem climbing over rocks. Leaflets, 13-17 cm. l., 12-15 cm. br.; petioles 1-2 dm. l. Bracts forming an involucre round the receptacle, the outer somewhat elliptical, the inner narrower and even linear. Pedicels about 1 cm. l. Flowers yellow. Calyx: tube 1-1.2 cm. l.; upper segment very broad, entire, lateral and lowest about equal, 8-9 mm. 1. Corolla: standard two-thirds as long as the wings, 5-5 5 cm. l.; wings 7-8 cm. l., slightly shorter than the keel. Pod 12 cm. l., 5 5 cm. br., covered with tomentum, amongst which are scattered bristly hairs. Seeds 1 or 2, flattened-roundish, 3·5-4 cm. in diam., almost surrounded by the hilum, which is about 1 cm. br.

4. M. pruriens DC. Prodr. ii. 405 (1825); leaflets, terminal rhomboid, lateral triangular, with long adpressed hairs beneath; peduncles as long as the petioles or longer, with numerous flowers, 2 or 3 together in a long raceme; pod with ribs along each margin concealed by dense brownish-yellow itching hairs.— Wright Mem. 209; Macf. loc. cit.; Bot. Reg. 1838, t. 18; Benth. loc. cit. t. 46, f. I. (II.) & II.; Griseb. loc. cit.; Urb. Symb. Ant. iv. 303. Cacara pruritus Rumph. Amboin. v. 393, t. 142. Phaseolus americanus foliis &c. Pluk. Stem climbing over bushes and low trees.

Stem climbing over bushes and low trees. Leaflets 7-15 cm. l, 6-9 cm. br.; petioles 1-3 dm. l. Flowers dark brown purplish, rarely light yellow and white. Calyx: tube 5-6 mm. 1., 3 upper segments triangular, acute,

as long as the tube, the lowest narrower and a little longer. Corolla: standard half as long as the wings; wings nearly $3\cdot 5$ cm. l.; keel a little longer than the wings. $Pod\ 4-8$ cm. l., about $1\cdot 5$ cm. br. $Seeds\ 2-6$, transversely oblong, with a short oblong hilum, spotted, about 1 cm. l.

17. GALACTIA Adans.

Twining, somewhat shrubby slender herbs. Flowers in clusters in racemes or occasionally simply clustered or solitary, the clusters springing from thickenings on the rhachis. Calyx-segments 4, acuminate, as long as the tube to more than twice as long. Uppermost stamen free, or rarely slightly united in the middle with the rest; anthers uniform, versatile. Style slender, without hairs; stigma small, terminal. Pod linear, compressed; the seeds separated by tissue.

Species 50, growing in the tropics, especially in America.

Corolla 2-2·5 cm. l	1.	G. pendula.
Corolla 1 cm. l. or less.		-
Twining or trailing vines.		
Raceme several- or many-flowered.		
Calyx hairy, 7 mm. l., segments twice as long as		
tube		$G.\ striata.$
Calyx subglabrous, 4 mm. l., segments as long as		
tube	5.	G. laxiflora.
Flowers solitary or few in a raceme.		•
Leaflets mostly elliptical	3.	G. uniflora.
Leaflets mostly linear to linear-oblong		
Erect shrub, 2 ft. high	6.	G. Jussigana.

1. G. pendula Pers. Syn. ii. 302 (1807) (excl. Cajenna); leaflets 1·5-7 cm. l., glabrous on both sides, or sometimes minutely puberulous on the midrib above, and puberulous beneath; calyx sparingly puberulous, 7-8 mm. l., lateral segments about as long as the tube, the others longer; standard 2-2·5 cm. l.; pod 7-9 cm. l., 6-9 mm. br., curved at apex, puberulous.—Bot. B. Standard × 1½.

C. Wing $\times 11$. (A, after Bot. Reg.)

shorter than the standard. Stamens alternately longer and shorter, uppermost quite free from the rest; anthers versatile, narrowly oblong. Seeds shortly ovate or subrhomboid, brown with blackish spots, 5-6 mm. 1.

2. G. striata Urb. Symb. Ant. ii. 320 (1900) (incl. vars.); leaflets 3-5 (2-8) cm. l., pubescent with adpressed hairs on the upper surface or glabrescent, more or less densely covered beneath with adpressed velvety hairs; calyx covered with silky adpressed hairs, 7(5-8) mm. l., segments 2 to $2\frac{1}{2}$ times longer than the tube; standard 7-9(-11) mm. l.; pod 4-7 cm. l., 6-9 mm. br., more or less densely pubescent.—G. filiformis Griseb. loc. cit. (in part) (non Benth.). G. cubensis H. B. & K. Nov. Gen. & Sp. vi.

429 (1824). Glycine striata Jacq. Hort. Vindob. i. 32, t. 76 (1770). Jacquin's type from Hort. Vindob. is in Herb. Mus. Brit. A specimen in Herb. Linn. has a ticket attached with Jacquin's name written by himself.

Houstoun! Lane in Herb. Sloane clxii. 78! Distin! Forster! Macfadyen Fairfield, Wullschlaegel; Kingston, Hitchcock; Yardley Chase, 1600 ft.; Luana Point; Great Goat Is.; Ferry R.; Hope grounds; Harris! near Angels Pen, Harris & Britton! Port Henderson, Ridley! Fl. Jam. 9677, 9926, 10,162, 11,791, 12,288.—Cuba, Hispaniola, Mona, Porto Rico, St. Thomas, Guadeloupe, Tobago.

Stem twining, climbing over low shrubs, pubescent or glabrate. Leaflets elliptical, seldom ovate-elliptical, petiolule of the terminal leaflet 4-12 mm.l.; stipules awl-shaped, 2-4 mm. 1. Inflorescence 2-8(-15) cm. 1., with several flowers in the upper half; peduncle 1-4.5 cm. l. Corolla, standard purple or rosy, marked with longitudinal lines, obovate; wings and keel about as long as the standard. Stamens, anthers versatile, narrowly oblong; uppermost filament free. Seeds kidney-shaped, 3.5-4 mm. l.

Urban (tom. cit. 321, 322) distinguishes five varieties; of these var. tomentosa agrees with Jacquin's type of the species; var. cubensis is a less hairy form, G. cubensis H. B. & K., G. filiformis Griseb. loc. cit. (in part)

(1860) (non Benth.).

The specimens from Luana Point and Angels Pen belong to var.

cubensis, the rest agree better with var. tomentosa.

3. G. uniflora Urb. Symb. Ant. ii. 325 (1900); leaflets 1-2(·8-3) cm. l., elliptical, obovate-elliptical, or oblong-elliptical, somewhat unequal, the terminal sometimes longer by one-third, with short soft adpressed hairs on both sides or glabrescent, netveined on both surfaces; inflorescence short, 1-3-flowered; peduncle (very short to 7 mm. l.) and pedicel (to 4 mm. l.) puberulous; calyx pubescent, 6 mm. l., segments about 15 times as long as the tube; standard 8-9 mm. l.; pod 3-4 cm. l., 4-4·5 mm. br., densely pubescent with adpressed hairs.— G. angustifolia *Hitchc. in Rep. Miss. Bot. Gard.* (1893) 77 (fide Urb. loc. cit., non Kunth). G. tenuislora Hitchc. tom. cit. 78 (fide Urb., non Wight & Arn.).

Lititz Savanna, 300-900 ft., Harris! Fl. Jam. 11,727.—Bahamas, Cuba. Stem very slender, twining amongst grasses, white-puberulous. Leaflets elliptical, obovate-elliptical, or oblong-elliptical, petiolule of the terminal leaflet 2-4 mm. l.; stipules awl-shaped, 1.5-2 mm. l. Corolla pale lilac. Stamen free above the base, shortly united in the middle to the rest. Seeds olive-green with dark-purplish markings, 2.5-3 mm. l. Possibly this is only a small form of G. dubia DC.

4. G. parvifolia A. Rich. in Sagra Cub. x. 176 (1845) & Ess. Fl. Cub. 414; leaflets differing much in number, form, and size, 3 or 1, linear to oblong or the lowest sometimes elliptical or elliptical-oblong, unequal, the terminal sometimes twice as long, ·5-8 cm. l., glabrous and prominently net-veined on the upper surface, more or less puberulous beneath; inflorescence short, 1-3-flowered; peduncle (·4-1 cm. l.) and pedicel (1-3 mm. l.) puberulous or glabrescent; calyx sparingly puberulous, 4-6 mm. l., the lowest segment lanceolate, acuminate, generally about twice as long as the tube, lateral and upper segments shorter; standard 9-12 mm. l.; pod 2-5·5 cm. l., 4-6 mm. br., hirtellous with adpressed hairs.—Urb. Symb. Ant. ii. 314 (1900) (incl. vars.). G. angustifolia (and vars.) Griseb. Cat. Pl. Cub. 75 (non H. B. & K.). G. stenophylla Urb. tom. cit. 313. Dolichos herbaceus minor foliis linearibus &c. Browne Hist. Jam. 294. D. filiformis L. Syst. ed. 10, 1163 (1759); Amon. v. 492 & Sp. Pl. ed. 2, 1021. Type of Linnæus's species is in Herb. Linn. and part of same specimen in Herb. Mus. Brit.

Frequent about Old Harbour, Browne! Old Harbour, Ridley!-Cuba,

Hispaniola.

Stem very slender, twining, minutely puberulous or glabrescent. Leaflets apex obtuse, mucronulate or subtruncate, papery; petiole 1-3 cm. l.; petiolule of terminal leaflet 4-1 mm. l.; stipules awl-shaped-lanceolate, 1·5-2 mm. l. Corolla red or purple (Wright); standard roundish, reflexed, claw 1·5 mm. l.; wings slightly shorter and narrower than keel; keel about as long as the standard; ovary 12-15 ovuled.

5. G. laxiflora Urb. Symb. Ant. ii. 315 (1900); leaflets $2 \cdot 5-4$ cm. l., glabrous on upper surface, hairy beneath with short adpressed hairs; calyx with a few very short hairs or subglabrous, $4-4 \cdot 5$ mm. l., segments subequal, as long as the tube, the uppermost a little longer; standard 7-8 mm. l.; pod 5-6 cm. l., $5-5 \cdot 5$ mm. br., sparingly puberulous.—G. filiformis Griseb. Fl. Br. W. Ind. 194 (1860) (in part) (non Benth.). G. Lockharti Fawc. Fl. Pl. Jam. 10 (1893) (non Griseb.).

Prior

Stem twining, hairy near the apex. Leaflets ovate-oblong or ovate-lanceolate; petiolule of the terminal leaflet 5-8 mm. l. Inflorescence to 20 cm.l., with several flowers distant from each other; peduncle 3-7 cm.l. Corolla, wings 6 mm.l., a little shorter than the keel. Stamen, uppermost free.

An incomplete specimen from Dr. Wm. Wright (?) in the Edinburgh

Herbarium may perhaps belong here.

6. G. Jussiæana Kunth Mimos. 196, t. 55 (1824); leaflets 2·5–7 cm. l., white-silky above, white-silky-tomentose beneath; calyx silvery-silky, 6–8 mm. l.; segments about twice as long as tube; corolla with reflexed-spreading standard, about 1 cm. l.; pod silky-tomentose, 5–6 cm. l., 5–6 mm. br.—H. B. & K. Nov. Gen. & Sp. 429; Benth. in Fl Bras. xv. pt. 1, 142; Urb. Symb. Ant. v. 373; Britton in Bull. Torr. Bot. Club xliii. 452. Clitoria glomerata Griseb. Cat. Cub. 74 (1866).

Bertero.—Cuba, Is. of Pines, Hispaniola, tropical S. America. Stem trailing ("repens" Kunth), erect, 2 ft. high (Britton), branches white-silky-tomentose. Leaflets elliptical; petiolule of the terminal leaflet 6-8 mm. l.; stipules lanceolate-awl-shaped, 2-4 mm. l. Inflorescence a

subsessile cluster to 3 cm. l., with several flowers. Corolla rosy; standard roundish-obovate, apex acute, ciliate; wings shorter than the standard and keel. Stamens, anthers versatile, elliptical; uppermost filament free.

We have not seen a specimen from Jamaica.

18. DIOCLEA H. B. & K.

Twining shrubs, Flowers in small clusters springing from thickenings on the elongated peduncle. Calyx campanulate, silky within, with 4 segments. Standard roundish, with infolded auricles at the base. Stamens united; alternate anthers very

small, sterile in *D. reflexa* and in some other species, uniform in other species. Pod compressed or swollen, the upper margin thickened or 2-winged, with tissue between the seeds.

Species 17, natives mostly of tropical America, of which two are found also in tropical Africa.

D. reflexa Hook. f. in Hook. Niger Fl. 306 (1849); Griseb. Fl. Br. W. Ind. 198; Wils. in Reports Geolog. Jam. 277; Bak. in Hook. f. Fl. Br. Ind. ii. 196; Urb. Symb. Ant. i. 473. Dolichos filiformis Macf. Jam. i. 286 (1837) (non L.).

"Lower hills on fences; St. Andrew," Macfadyen; Wilson!—West Indies, America, Africa, tropical Asia, New Guinea.

Stem stout, climbing over high trees; branches, petioles, and inflorescence covered with brownish spreading hairs or glabrate. Leaflets elliptical, more or less pubescent with adpressed hairs, longer and denser on the midrib and nerves, or more or less glabrate, 8-16 cm. l. Raceme long, 1·5-3 dm. l. Bracts long, lanceolate or linear, reflexed, deciduous, about 1·5 cm. l. Bracteoles small, roundish. Calyx about 1·5 cm. l., brownish-silky; upper segment emarginate. Corolla reddish verging on violet with a yellow spot at the base of the standard; standard with 2 prominent calli in the centre at the base, about 2 cm. l.; wings rhomboid, very broad, auricle triangular, about as long as the standard; keel-petals adherent in the upper half, shortly beaked, a little shorter than the wings. Pod oblong, 9-13 cm. l., 4·5-6 cm. br.; upper margin much thickened, furrowed, lower less so. Seeds 1-3, roundish, 2·5-3 cm. l., hilum linear, elongated.

19. CANAVALIA Adans.

Herbs, twining or (in C. obtusifolia) creeping. Leaves pinnately 3-foliolate. Flowers clustered at minute tubercles along the rhachis of a raceme. Calyx 2-lipped; upper lip very large, entire or 2-lobed, lower small, 3-lobed. Standard roundish, reflexed. Filaments of stamens all united into a closed sheath, or the uppermost stamen free at the base and slightly adhering above; anthers uniform, versatile. Pod large, compressed, with a longitudinal rib on each side near the upper margin, with tissue between the seeds.

Species 12, natives of the tropics.

Stem creeping. Leaflets roundish to obovate-elliptical... 1, C. obtusifolia. Stem climbing. Leaflets ovate-elliptical or elliptical.

Standard auriculate. Ribs of pod 3-7 mm. from

margin 2. C. ensiformis.
Standard without auricles. Ribs of pod 1 cm. from
margin 3. C. altissima.

1. C. obtusifolia DC. Prodr. ii. 404 (1825); stem creeping; leaflets roundish to obovate-elliptical, apex rounded, sometimes emarginate, terminal often somewhat wedge-shaped, glabrescent at base; racemes few-flowered; standard auriculate; pod few-seeded, ribs close (2-3 mm.) to the margin.—Benth. in Fl. Bras. xv. pt. i. 178, t. 48; Griseb. Fl. Br. W. Ind. 197; Bak. in Hook. f. Fl. Br. Ind. ii. 196; Urb. Symb. Ant. iv. 306. C. rosea Macf. Jam. i. 292 (1837). Phaseolus maritimus purgans &c. Pluk. Horse Bean, Overlook Bean, Sword Bean, Jack Bean. Sloane Herb. iii. 67! Macfadyen; Maroon Town, St. James, Knollys!-Tropics.

Stem climbing high, glabrescent. Leaflets 7-13 cm. l. Racemes to 3 dm. and longer, flowering in the upper half. Flowers pendulous, white tinged with red or purplish-violet. Calyx about 1.25-1.5 cm. l., upper lip emarginate. Corolla, as in C. obtusifolia, nearly 3 cm. 1. Uppermost stamen free at base and slightly adhering to the sheath above. Pod 1.5-2.5 dm. l., 2.5-3.5 cm. br., linear-oblong, slightly curved, glabrescent or glabrous. Seeds reddish or white, to 2 cm. l.

Experiments seem to show that the food value of this bean for cattle is great, as indicated by Church's analysis ("Food Grains of India"). The tender half-grown pods of a variety, mollis, which grows in India in the Nilghiri hills, are eaten in the same way as French Beans.

species is extensively grown as a cover crop, and soil renovator.

3. C. altissima Macf. Jam. i. 292 (1837) (excl. syn.); stem twining, climbing high; leaflets elliptical or oblong-elliptical, sometimes somewhat obovate, apex blunt, sometimes emarginate, mucronulate, glabrous; upper lip of calvx shorter than the tube; standard without auricles; ribs of pod distant (1 cm.) from the margin.—Griseb. loc. cit. (Fig. 19.)

Overlook Bean.

Port Royal and St. John's Hills, Macfadyen! Distin! Gosse! March!

Port Royal and St. John's Hills, Macjaayen! Distin! Gosse! March! J. P. 988, Morris! Guava Ridge, 1000 ft.; near Troy, 2,500 ft., Harris! Stem glabrous. Leaflets 7-9 cm. l. Racemes to 1 dm. l., sometimes branched; peduncle about as long or shorter. Flowers pendulous, white, standard dark-purple. Calyx about 1.25 cm. l., upper lip entire, sometimes reflexed, emarginate. Corolla: standard strongly reflexed, emarginate, 2 cm. l.; keel about as long as the standard and longer than the wings, and curved in a semicircle. Stamens, uppermost free at base and slightly adhering to the sheath above. Pod about 1.5 dm. l., 2.5 cm. br., linear-oblong, slightly curved, puberulous with adpressed hairs. Seeds black, 1.5 cm. l., or "dirty-white" (Macfadyen).

20. PHASEOLUS L.

Herbs, sometimes woody at the base, twining or erect. Leaves pinnately 3-foliolate, stipellate; stipules persistent, ribbed. Flowers clustered at node-like thickenings along the rhachis of a raceme. Bracts generally caducous, stipule-like or very small; bracteoles often broader, sometimes persistent for long. Calyx campanulate, teeth 4, shorter than the tube. Standard roundish; keel prolonged into a long beak, forming a complete spiral. Uppermost stamen free, the rest united; anthers uniform. Style thickened within the beak of the keel and twisted with it, hairy longitudinally on the inside above; stigma oblique or lateral. Pod compressed or sub-cylindrical, beaked, with a slight amount of tissue between the seeds.*

^{*} We have transferred the two species, P. peduncularis and P. antillanus, to the genus Vigna, as they show no indication of the complete spiral twist of the keel, which seems to be the only character that differentiates the two genera.

Species 150, dispersed through the tropics, subtropics, and southern Europe.

Calvx 4-toothed. Leaflets ovate to ovate-rhomboid. Corolla 1.5-2 cm. l. Lateral teeth of calyx triangular, not falcate.

Bracteoles much shorter than the calyx. Pod, upper margin recurved, lower broadly rounded 1. P. lunatus.

Bracteoles longer than, or equalling, the calyx. Pod oblong-linear, upper margin straight or

Corolla 2-2.5 cm. l. Lateral teeth of calyx lanceolate-

Calyx 5-toothed. Leaflets ovate-lanceolate to linear.... 4. P. lathyroides.

..... 3. P. adenanthus.

P. psoraleoides Wight & Arn. Prodr. 244 (1834); Wight Ic. t. 249. Types in Herb. Mus. Brit.

Savanna, St. Jago de la Vega, Sloane Herb. iii. 84! Browne; Wright! Swartz! Distin! Prior; roadsides, Jenman! King's House, J.P. 1357, Morris! Hope grounds, Harris! Kingston, Rothrock; Port Morant, Hitchcock; Porus, Lloyd.—Tropical America, India, Malaya.

Rhizome perennial, or in cultivated ground the root annual (fide

Benth.). Stem erect, a foot or more high, shrubby at base, with whitish deflexed hairs. Leaflets 3–7 cm. 1. Racemes 7–12 cm. 1.; peduncles 1·5–3 dm. 1.; pedicels very short, geminate. Bracts and bracteoles bristle-like, deciduous; bracts 6 mm. 1., bracteoles 3 mm. 1. Calyx 4–6 mm. 1.; teeth much shorter than the tube, upper triangular, lower lanceolate, awned. Corolla blood-coloured; standard about 1·5 cm. 1., concave, narrowed at the base, pale red; wings about twice as long as the standard, deep crimson; keel whitish. Pod spreading, many-seeded, 8–10 cm. 1. Seeds ellipsoidal, brown.

The Linnean species *P. lathyroides* is based on the Jamaican specimens of Sloane & Browne, which have narrow leaves; this form is distinguished by Bentham as *P. semiercetus* v. angustifolia. The typical *P. semiercetus* (Plukenet in Herb. Sloane xevii. 84 in Herb. Mus. Brit.) has ovate-elliptical leaves. Both forms occur in Jamaica. Plukenet's specimen has the leaves and pods of this species, and also the pods of apparently *P. Mungo* L., and these pods of another species have been drawn in Plukenet's figure as

attached to the leafy twig.

21. VIGNA Savi.

Herbs, twining, prostrate or erect. Leaves pinnately 3-foliolate; stipules sessile or produced at the base below the insertion (V. unguiculata); stipels persistent. Peduncles axillary, bearing racemes or capitate umbels of flowers, the flowers springing from thickenings on the rhachis. Calyx campanulate, 4-5-lobed or toothed. Standard roundish, auricles folded upwards; keel incurved, not beaked, or the beak not forming a complete spiral. Uppermost stamen free, the rest united; anthers uniform. Style with a row of hairs near the apex; stigma lateral or oblique. Pod straightish, subcylindrical or compressed, with a thin layer of tissue in which lie the seeds.

Species about 33, growing in the tropics.

although it is quite likely that it may occur, as its distribution in the West Indies is Cuba, Hispaniola, Porto Rico, St. Vincent, Grenada, and it is found in the tropics generally. It differs from V. repens in the umbellate inflorescence, calyx 5-toothed, and the pod with longer straighter beak. A specimen in Herb. Edinb. labelled "Phaseolus vexillatus-Jamaica," is V. repens.

2. V. peduncularis comb. nov.; leaflets ovate to triangularovate acuminate; stipules sessile; inflorescence a raceme with the clusters of flowers somewhat distant on the rhachis near the apex of the peduncle; bracteoles shorter than the calyx; calyx 4-toothed, lateral teeth triangular, not falcate; corolla 2 cm. l.; pod narrowly linear, nearly straight, to 5 mm. br.—P. peduncularis H. B. & K. Nov. Gen. & Sp. vi. 447 (1824); Benth. tom.

Near Priestman's River, Harris! Fl. Jam. 5979.—Panama and tropical S. America.

Stem twining, pubescent, at length glabrous. Leaflets 2–5 cm. l. Racemes 2–6 cm. l., peduncles 1–2 dm. l. and sometimes much longer; pedicels very short. Bracts and bractcoles oblong-elliptical, ribbed, deciduous; bracts 1·5 mm. l., bracteoles 3 mm. l. Calyx 4 mm. l.; teeth ciliate, upper tooth rounded, emarginate, lower teeth ovate, apex rounded or obtuse. Corolla purple; standard about 1·5 cm. l., wings about 2 cm. l., keel somewhat in the form of the letter S. Pod 6–10 cm. l. Seeds brownish, about 2 mm. l.

- 3. V. antillana comb. nov.; leaflets triangular to ovate-oblong; stipules sessile; inflorescence a raceme with few clusters of flowers distant on the rhachis near the apex of the peduncle; bracteoles much shorter than the calyx; calyx 4-toothed, lateral teeth lanceolate-falcate; corolla 2-2·5 cm. l; pod linear, straightish, with thickened margins, to 5 mm. br.—Vigna unguiculata Griseb. in Mem. Acad. Amer. Sc. & Art. n. ser. viii. 178 (1860) & Cat. Cub. 76 (non Walp.). V. sinensis Rolfe in Kew Bull. 1893, 247 (in part) (non Endl.). Phaseolus antillanus Urb. Symb. Ant. iv. 309 (1905) & vi. 103. P. unguiculatus Piper in Torreya xii. 190 (1912).
- C. V. Piper bases his name for the species on the supposed identity of Linnæus's original specimen of Dolichos unguiculatus with the plant described by Urban as Phascolus antillanus, but there is no specimen so named by Linnæus in his Herbarium, nor from the evidence of his own lists does it appear that there ever was one. Further there is no specimen that agrees with Phascolus antillanus Urb.

March (fide Urban).—Cuba, Hispaniola, Porto Rico, Martinique,

St. Vincent.

Stem twining, with a length of over 20 ft., with few scattered hairs. Leaflets, terminal triangular to ovate-oblong, acuminate, 5–7 cm. l., lateral very unequal-sided, obliquely ovate, base subtruncate, membranous, with a few short hairs or subglabrous. Raceme about 1 dm. l.; peduncle 1–3 dm. l.; pedicels 1–2 mm. l., in fr. to 4 mm. l. Bracts minute, roundish, 1 mm. l. Bractoles elliptical, ribbed, about 3 mm. l. Calyx: tube campanulate, about 4 mm. l.; upper tooth short, truncate or scarcely emarginate, lateral a little shorter than the tube, lower triangular, slightly shorter than the lateral. Corolla apparently purplish; standard broadly ovate, not or scarcely emarginate, about 2 cm. l., and 1·7 cm. br. below; wings 1·8–2·5 cm. l.; keel at $\frac{1}{3}$ of its length, 5–7 mm. br. and then bent at right angles, above narrowing and forming a tube at the apex. Pod 8–13 cm. l. Seeds brown with black markings, about 4 mm. l.

[PACHYRRHIZUS DC.

Twining herbs. Leaves pinnately 3-foliolate. Flowers blue, clustered-racemose. Calyx 4-lobed, lobes subequal, upper emarginate. Standard roundish-obovate, auricled at the base. Uppermost stamen free, the rest united. Style compressed above and hairy; stigma subglobose on the inner face. Pod compressed, transversely impressed outside and with tissue inside between the seeds.

Species 3, of which two are widely dispersed in the tropics of

America and Asia, indigenous, or cultivated on account of its edible, tuberous root.

P. tuberosus Spreng. Syst. iv. Cur. Post. 281 (1827); Kew Bull. 1889, 17: Oliv. in Hook. Ic. Pl. t. 1843; Jam. Bull. 1893, 44. Phaseolus radice tuberosa &c. Plum. Cat. 8 & Pl. Amer. (Burm.) t. 220. Dolichos tuberosus Lam. Encyc. ii. 296 (1786): Macf. Jam. i. 285; Descourt. Fl. Ant. viii. 127, t. 554.

Yam Bean.

Cultivated, and possibly native, in Jamaica, some other W. Indian

Islands, and tropical S. America; probably native in S. America.

Stem 10-20 ft. with a large tuberous root. Leaflets, 10-17 cm. l. and br., terminal rhomboid, shortly acuminate, lateral very unsymmetrical, somewhat triangular, mostly entire. Inflorescence, clusters of 2 or 3 flowers, more or less crowded along the upper part of the long stalk. Callyx about 1 cm. l. Corolla white, 1.5 to nearly 2 cm. l.; 2 calli at base; auricles turned up on the standard and the inner edge folded outwards; claw short; wings as long as the standard, the auricle with an awl-shaped or tail-like projection; keel a little longer than the wings, auricle very small, tooth-like, a pocket-like fold on the outside near the auricle. Pod 2 dm. l., about 2 cm. br., 6-8-seeded, with reddish hairs; beak 3 cm. l., sharply triangular. Seeds 1.3 cm. l., 1 cm. br., generally red.

The tuberous roots afford a plentiful supply of wholesome food; the

The tuberous roots afford a plentiful supply of wholesome food; the produce of three plants is usually a bushel; the young pods are used like French Beans. For further information see Macfadyen and Jamaica

Bulletin (loc. cit.).

P. erosus Urb. (P. angulatus L. C. Rich.) is also cultivated in some of the W. Indian Islands (though not in Jamaica) as well as in the tropics of the Old World. It differs in the leaflets with angular lobes, the flowers violet-coloured, and the pods about half the length of those of P. tuberosus.]

[DOLICHOS L.

Shrubby twining herbs with the habit of *Phaseolus*. Leaves pinnately 3-foliolate. Flowers clustered at node-like thickenings along the rhachis of a raceme; peduncle long, bearing a leaf. Calyx campanulate, shortly 4-lobed. Standard transversely elliptical, with a large 4-lobed callus extending from the middle to the base, forming a small auricle on each side; keel curved at a right angle. Uppermost stamen free, the rest united; anthers uniform. Style flattened upwards, narrowed at the base, hairy along the upper edge below the terminal stigma. Pod compressed, oblong, slightly recurved, beaked, 2–4-seeded, with some tissue between the seeds.

Species about 30, natives of the tropics.

D. lablab L. Sp. Pl. 725 (1753); Benth. in Fl. Bras. xv. pt. 1, 197, t. 51, f. II.; Griseb. Fl. Br. W. Ind. 196. Phaseolus maximus perennis floribus &c. Sloane Cat. 67, 68 & Hist. i. 177, t. 113. Bonavist Bean, Lablab Bean.

Sloane Herb. iii. 65! Macjadyen; Hopewell wood, St. Mary, McNab! Prior; Resource, Blue Mts., J. P. 1254 Hart! also Harris! Hope grounds, Harris! Fl. Jam. 5594, 10,801; Port Antonio, Hitchcock.—Widely cultivated, and often naturalized, in the tropics; native country probably tropical Africa.

A wide-climbing perennial. Leaflets ovate-deltoid, lateral somewhat unsymmetrical, generally 7-12 cm. l. Racemes lax, 8-16 cm. l., at the top of a strong stalk. Bracteoles 4 mm. l., broadly elliptical, deciduous. Calyx 6-8 mm. l., densely hairy on margin between the lobes. Corolla white, purple, or violet; standard nearly 1.5 cm. l., breadth exceeding 1.5 cm.; wings somewhat triangular, with an auricle above the long claw, as long as the standard. Pod rough with warty projections along the margins (at any rate in the younger pods), 4-8 cm. l., 1.8-2 cm. br. Seeds white, whitish-red, dark purple, or black.

"Planted for food as well as ornament" (Sloane). "The bean is very coarse, scarcely ever cultivated, and seldom made use of, except in times

of scarcity" (Macfadyen).]

§ 9. Herbs or shrubs, erect or twining. Leaves pinnately 3-foliolate or subdigitately 1-3-foliolate; leaflets with glandular dots beneath, without stipels. Flowers in racemes. Uppermost stamen free. Pod 2-valved.

[CAJANUS DC.

An erect undershrub. Leaves pinnately 3-foliolate; leaflets with minute resinous dots underneath. Racemes axillary. Calyx: upper 2 lobes united higher up than the rest. Standard roundish, auricled at the base. Uppermost stamen free, the rest united. Style thicker above the middle; stigma terminal, oblique. Pod compressed, marked outside with oblique depressed lines between the seeds, with indications inside of partitions.

Species 1, widely cultivated throughout the tropics, probably

a native of the Old World.

Gungo Pea, Pigeon Pea, No Eye Pea.
Barham in Herb. Sloane clxxxiv. 7! Sloane Herb. vi. 1! Wright!
Purdie! Gordon Town, Ball! Mavis Bank.

Campbell! Robertsfield and Resource, Blue Mts., Harris! Fl. Jam. 6163-7, 6603; Port Antonio, Lucea, Hitchcock.—Tropical and subtropical regions.

Shrub 4 to 10 or 12 ft. high, with woody trunks and branches. Leaflets narrowly elliptical to lanceolate, 4-9 cm. l. Flowers nearly 2 cm. l. Calyx about 1 cm. l., lowest lobe longer than the rest. Corolla yellow or yellow and orange; standard about 1.7 cm. l. and br., callus running up from the claw and branching, the outer semicircular passing into the auricle; wings somewhat semicircular, auricled at each side of the base, with a slender claw, as long as the standard; keel somewhat semicircular, with an infolded pocket near the base, about as long as the wings. Pod usually 5-seeded, 5-8 cm. l. The "No Eye Pea" has a corolla of a uniform yellow colour, whereas the "Gungo" or "Pigeon Pea" has the yellow corolla blotched with orange or red, and the calyx, pods and seeds are also marked with purple blotches or spots.]

22. RHYNCHOSIA Lour.

Herbs or undershrubs with minute yellow glands, twining in Jamaican species. Leaves pinnately 3-foliolate; leaflets with resinous dots underneath. Flowers solitary or geminate in racemes, simple or paniculate. Calyx: upper 2 lobes more or less united. Standard obovate or roundish, auricled at base. Uppermost stamen free, the rest united. Stigma small, terminal. Pod compressed, shortly beaked. Seeds 2 or 1.

Species 100, natives of the tropics, some outside the tropics in N. America and S. Africa.

Pods not constricted between the seeds.

1. R. reticulata DC. Prodr. ii. 385 (1825); calyx slightly longer than the corolla, segments narrowly lanceolate-acuminate, much longer than the short tube; the upper two united beyond the middle; lateral shorter, lower longest; pod oblong, slightly narrowed at both ends; leaflets with yellow dots beneath.—Macf. Jam. i. 277; Benth. in Fl. Bras. xv. pt. 1, 203; Griseb. Fl. Br. W. Ind. 190; Urb. Symb. Ant. iv. 307. Glycine reticulata Sw. Prodr. 105 (1788) & Fl. Ind. Occ. 1251.

Houstoun! Shakspear! Macfadyen! Cambridge Hill, St. David, McNab! St. Cruz Mts., Purdie! Wilson! Mavis Bank, J.P. 1338, Hart! Robertsfield, Morris!—Cuba, Hispaniola, Mona, Porto Rico, St. Thomas, St. Cruz, St. Jan, St. Martin, St. Bartholomew, St. Kitts, Antigua, Guadeloupe, St. Vincent, S. America.

Stem, younger angled, tomentose or villose. Leaflets variable in shape and size, ovate to lanceolate or elliptical-rhomboid, softly tomentose on both sides and prominently reticulate-veined beneath, 2-9 cm. l. Racemes many-flowered, 1-8 cm. l. Calyx '7-1'1 cm. l., tomentose or villose outside. Corolla yellow; standard obovate-elliptical, with auricles infolded at the base, '6 to nearly 1 cm. l.; claw linear-wedge-shaped,

 $1\cdot 2-2$ mm. l.; wings oblong with a sharp pointed auricle at the base, much shorter than the keel, claw slender, $1\cdot 5-2$ mm. l.; keel oblong-elliptical, truncate at base, as long as the standard. Pod minutely tomentose, about 2 cm. l., 7–9 mm. br. Seeds roundish-kidney-shaped, dark brown with black spots, $4\cdot 5$ mm. in diam.

2. R. minima DC. Prodr. ii. 385 (1825); calyx about one-half to two-thirds as long as the corolla, segments longer than the tube, upper 2 lanceolate, lateral similar but broader and shorter, lower longest, narrowly lanceolate, acuminate; pod oblong, narrowed towards the base, slightly curved; leaflets with

Town Savanna, St. Jago de la Vega, Sloane Herb. iii, 79! Lanc in Herb. Sloane clxii. 78! Houstoun! Broughton! Macfadyen! Distin! McNab! Parnell! March! Hope grounds; King's House grounds; near Lititz; Bellevue, near Spanish Town; Hope; Harris! Watson Hill, Faucett! Fl. Jam. 6804, 6958, 7247, 8396, 11,913, 11,980.—Tropical and subtropical regions.

Stem angled, puberulous or glabreseent. Leaflets small, ovate-rhomboid, puberulous, rarely tomentose, 1·5-2·5 (1-3) em. l. Flowers distant, yellow. Calyx 3·3-4·5 mm. l. Standard about ·6 em. l., veined with red or purple, obovate with auricles at base slightly inflexed, claw wedge-shaped, about 1·3 mm. l.; wings shorter than the keel (claw 1·5 mm. l.), narrowly oblong, truncate at base; keel oblong-elliptical, rounded at apex, truncate-wedge-shaped at base, about as long as the standard and twice as broad as the wings, claw about 2 mm. l. Pod minutely puberulous, 2-seeded, 1·3-1·7 em. l., ·4-·5 em. br. Seeds ellipsoidal, slightly indented on one side, black, 2·5-3 mm. in diam.

3. R. caribæa DC. Prodr. ii. 384; calyx about one-third to one-half as long as the corolla, upper 2 segments triangular, acute, lateral ovate, acuminate, a little longer than the upper, lower segment lanceolate from a broad base, aristate, longer than the lateral; standard obcordate; wings with claw-like auricle; pod hirsute; leaflets with yellow glandular dots beneath.—Macf. Jam. i. 275. Glycine caribaea Jacq. Collect. i. 66 (1786) & Ic. Pl. Rar. t. 146; Bot. Reg. t. 275.

There is in Herb. Mus. Brit. a description of this species from a garden plant by Solander (MSS. xv. 239), and also a specimen labelled "Hort. Kew. 1779." Jacquin's description is of a plant raised from seed brought by him "ex insulis Caribæis," and presumably the figure in Ic. Pl. Rar. is of the same plant. The Bot. Reg. states "the plant from which the drawing has been taken was raised from Jamaican seed." Macfadyen gives as its habitat, "on fences, neighbourhood of Bath." We have not seen a specimen collected in Jamaica.

Stem pubescent or glabrate. Leaflets small, rhomboid, acute or acuminate, puberulous with scattered hairs on the upper surface, puberulous on the nerves and veins beneath, 1·5–3 cm. l. Flowers "about half an inch long, deep yellow" (Bot. Reg. t. 275). Standard with purplish streaks, auriculate; keel purplish at the apex. Pod 2·5–3 cm, l., scimitar-shaped, with glandular dots.

4. R. phaseoloides DC. Prodr. ii. 385 (1825); calyx about one-third to one-half as long as the corolla, segments about as long as the tube, upper and lateral triangular, lower awl-shaped; pod constricted between the seeds, about 1 cm. br.; leaflets with orange-yellow dots beneath.—Macf. Jam. i. 276; Benth. loc. cit. t. 54, f. i.; Griseb. loc. cit.; Urb. loc. cit. Glycine sylvestre scandens &c. Browne Hist. Jam. 298. G. phaseoloides Sw. Prodr. 105 (1788) & Fl. Ind. Occ. 1248.

Decoy, St. Mary, Browne; Wright! Masson! Swartz! Bancroft! Macfadyen! St. Mary, McNab! Purdie! Wilson! Moneague, Prior! J.P. 872, Morris! Chester Vale, 3000 ft.; Knapdale, near Browns Town, 1000 ft.; Mt. Diabolo; near Troy, 2000 ft.; Harris! Fl. Jam. 5636, 5875, 7093, 8494, 8775.—West Indies, Central and South America.

Stem trailing, sometimes growing to a length of 18 ft., subterete, tomentose-puberulous or glabrescent. Leaflets broadly ovate to rhomboid, acuminate, glabrous on upper surface, puberulous or minutely tomentose

beneath, 3–8(–12) cm. l. Racemes with many brownish-yellow flowers, 5–15 cm. l., sometimes branching. Calyx hirtellous, 3–4 mm. l., lower segment 4 mm. l. Standard somewhat obovate-roundish, with purplish veins, puberulous outside, and often with minute glandular dots, with minute slightly inflexed auricles at the base, '8–1 cm. l. (incl. claw, wedge-shaped, 1·6 mm. l.): wing oblong, shorter than the standard, with a triangular acute auricle (claw 2 mm. l.); keel subfalcate, almost semi-elliptical, about equal to the wings, and twice as broad (claw 2·4 mm. l.). Pod puberulous, especially on the edges, at length glabrate, 2–seeded, 2–2·5 cm. l., or sometimes 1-seeded, 1·5 cm. l. Seeds ellipsoidal, black, scarlet only round the hilum, or extending over half or the greater part of the surface, about 6 mm. in diam., somewhat like those of Abrus precatorius, and the plant is therefore sometimes (though wrongly) called "Wild Liquorice."

[FLEMINGIA Roxb.

Erect undershrubs or shrubs, in species occurring in the West Indies. Leaves digitately 1–3-foliolate; leaflets with prominent veins and glandular dots beneath. Inflorescence various; in *F. strobilifera*, flowers in small cymes, each cyme hidden by a large folded persistent bract closely and distichously arranged in axillary racemes; in *F. stricta*, flowers in dense subspicate axillary racemes, the bracts linear or lanceolate, caducous. Calyx-tube short; segments narrow, acuminate, the lowest often the longest. Standard auricled at base. Uppermost stamen free, the rest united. Stigma small, terminal. Ovules 2. Pod short, swollen.

Species about 22, natives of tropical Asia, Africa, and

Australia.

Leaves 1-foliolateF. strobilifera.Leaves 3-foliolateF. stricta.

1. F. strobilifera R. Br. in Ait. Hort. Kew. ed. 2. iv. 350 (1812); leaves 1-foliolate; bracts, persistent, and broadly cordate.—Wight Ic. t. 267; Griseb. Fl. Br. W. Ind. 191; Bak. in Hook. f. Fl. Jam. 6974, 10,070, 11,770; Bog Walk, Hitchcock; Port Antonio, Rothrock.—East Indies, introduced in West Indies and Mauritius.

Shrub to 5 ft. and more. Leaves elliptical, narrowing to the apex, ·5-2 dm. l.; petiole 1-2 cm. l. Inflorescence 5-15 cm. l. Bracts broader than long, 1·2-2·5 cm. l. Calyx 5-6 mm. l., pubescent. Standard 6·5 mm. l.; wings 5 mm. l.; keel not extending beyond the standard, but

curved upwards. Pod about 1 cm. l.

2. F. stricta Roxb. ex R. Br. in Ait. Hort. Kew. ed. 2, iv. 349 (1812); Roxb. Corom. Pl. iii. 44, t. 248 (1819); leaves digitately 3-foliolate; bracts linear or lanceolate, caducous.—Wight Ic. t. 329; Bak. tom. cit. 228.

Purdie! J.P. 722, Jenman! near Browns Town, Harris! Fl. Jam. 7269. Shrub with woody 3-angled branches. Leaflets lanceolate, oblong, or narrowly elliptical, acuminate, 1–3 dm. l.; petiole 3-angled, '5–1·5 dm. l.; stipules large, lanceolate, scarious, deciduous, 7–9 cm. l. Inflorescence ·5–1·5 dm. l. Bracts 1·5–2 cm. l. Calyx (incl. shorter segments) about 5 mm. l., with lower segment 9 mm. l., silky. Standard 9 mm. l.; wings 7 mm. l.; keel about as long as the standard. Pod about 1·3 cm. l.]

§ 10. Trees, or shrubs with trailing or twining branches. Leaves imparipinnate with several leaflets, sometimes only 3 or 1; leaflets without stipels (except rarely in Lonchocarpus and Andira). Flowers in axillary panicles or racemes, panicles terminal or subterminal in Andira. Stamens 10, all united into a sheath, split on the upper side or on both upper and lower sides, or the upper stamen more or less free, or wanting. Pod not splitting open, membranous, leathery, woody or drupaceous.

23. DALBERGIA Linn. f.

Trees, or shrubs with twining or trailing branches. Leaves alternate, with one leaflet or 3-5 (2) leaflets, imparipinnate; eaflets alternate. Flowers in axillary panicles. Calyx with 5 unequal segments, the two upper broader, the lowest longer. Standard obovate or roundish. Stamens, all united into a sheath split on the upper side, or the upper stamen free or wanting, or the sheath is split also on the lower side; anthers small, didymous, the cells opening by a chink at the apex. Ovary stalked; stigma small, terminal; ovules 2 or few. Pod not splitting open, oblong or roundish, flat, thin, with 1-4 seeds.

Species 80, growing in the tropics in America, Africa, and Asia, of which two are also found in Australia.

1. D. Brownei Urb. Symb. Ant. iv. 295 (in Obs.) (1905); leaflets solitary, ovate-elliptical, subcordate or emarginate at base, glabrous; stalk of ovary shorter than the calyx; pod oblong or linear, 3-4-seeded, or sometimes 1-seeded.—D. Browne! Wright! Distin! Cuming! McNab! sea coast, near Turtle Crawl, Portland, Purdie! March; Dover, Metcalfe! Port Antonio, Hitchcock; also Harris! Fl. Jam. 5997.—Florida, West Indies, Central and S. America, western tropical Africa.

Shrub or shrubby tree, 10 ft. high. Leaflets 4-11 cm. l. Flowers numerous, white, fragrant. Calyx 3-3·5 mm. l., tomentose; segments subequal, 2 upper broad, obtuse, lateral and lower triangular, lower slightly longer than the lateral. Standard round, sometimes with retuse apex, 7 mm.l.; wings somewhat elliptical, longer than the standard; keel-petals united at the back, apex obtuse, base auriculate, 6 mm. l. Stamens 10, sheath split above and below. Pod 2-3 cm. l.; stalk 3 mm. l.

3. D. monetaria Linn. f. Suppl. 317 (1781); leaflets 3-5, sometimes 2, elliptical to roundish-elliptical, shortly acuminate, glabrous; stalk of ovary longer than the calyx; pod oval-roundish, 1-seeded.—Urb. tom. cit. 295. Ecastaphyllum Richardi var. monetaria Pers. Syn. ii. 277 (1807). E. monetaria DC. Prodr. ii. 421 (1825); Griseb. loc. cit. (under Hecastophyllum), Benth. loc. cit. & in Fl. Bras. loc. cit. t. 63, 64 (excl. flowering spec.). Type in Herb. Linn.

Morris! Castleton, Harris! Fl. Jam. 12,080.—West Indies, S. America. Shrub or tree or with woody stems, climbing widely by means of twining branches. Leaflets 5-13 cm. l. Flowers white or yellowish-white; panicles contracted, short, somewhat corymbose. Calyx about 3 mm. l., sparsely puberulous, segments subequal, bluntly triangular, 2 upper broader. Corolla: petals of nearly equal length, about 6 mm. l.; standard round, obcordate, claw as long as the blade; wings elliptical, auriculate, long-clawed; keel-petals united near the apex, somewhat elliptical, auriculate, long-clawed, slightly shorter than the wings. Stamens 9, in two bundles of 4 and 5, and 1 of the five more or less free. Pod glabrous, 2·5-3·5 cm. l.; stalk 5-6 mm. l.

24. PTEROCARPUS Jacq.

Trees. Leaves imparipinnate; leaflets alternate or irregularly opposite. Flowers yellow, usually in panicles. Calyx unequally 5-toothed, top-shaped. Standard roundish; wings obliquely obovate, keel-petals shortly connected. All the stamens united into a sheath split above or above and below; anthers versatile. Stigma small, terminal. Pod roundish, compressed, not opening, the style lateral, 1 or 2 seeds in the middle, more or less thickened or hardened, attenuated all round the edge.

Species 20, natives of the tropics in America, Africa and

Asia.

P. officinalis Jacq. Sel. Stirp. Amer. 283, t. 183, f. 92 (1763) & Ed. pict. t. 264, f. 91; Urb. Symb. Ant. iv. 296.—P. draco L. Sp. Pl. ed. 2, 1662 (1763) (with reference to Jacq. only);

Manchioneal, Wilson!-Porto Rico, Guadeloupe, Dominica, St. Lucia,

St. Vincent, Trinidad, central America, northern S. America.

A glabrous tree, 25-30 ft. high. Leaflets 5-9, oblong-elliptical or elliptical, shortly acuminate, shining, 5-1.5 dm. l. Panicles lax, 5-1.5 dm. l. Calyx 5-6 mm. l. Standard narrowed at the base into the long claw, 1.1-1.3 cm. l.; wings nearly as long; keel shorter than the wings. Ovary stalked. Pod shortly stalked, very oblique, veiny, about 4 cm. in diam.

Linnæus (loc. cit.) gives no diagnosis, he mercly refers to his Mat. Med. 522 and Jacq. Hist. 283, t. 183, f. 92. Pterocarpus of the Mat. Med. is based on Hermann's Fl. Zeyl. 417, of which there are two specimens in Hermann's Herb., both of which, as Trimen pointed out, are *Derris uliginosa*, an Old World species; Jacquin's name applies to the American species, and also has priority over P. Draco L.

25. LONCHOCARPUS H. B. & K.

Trees, or high trailing shrub (L. patens). Leaves alternate, imparipinnate; leaflets opposite. Flowers in racemes; pedicels generally 2-flowered, sometimes 2 pedicels together. Calyx truncate; teeth 5, very short or obsolete. Standard roundish. Uppermost stamen free only just at the base, united above the base with the rest into a closed tube; anthers versatile. Stigma small, terminal. Pod flat, not opening, not winged, with 1-4 seeds.

Species 60, natives of tropical America and Africa, one Australian.

Pedicels longer than the flowers, spreading. Pod reticulate...... 1. L. patens.

Pedicels not longer than the flowers. Pod smooth.

Flowers less than 1 cm. l. Calyx 2-2.5 mm. l. Pod thin, parchment-like 2. L. latifolius.

Flowers more than 1 cm. l. Pod woody.

Leaflets puberulous beneath. Calyx 3-4 mm. l.

Leaflets glabrous. Calyx 5-6 mm. l. Corolla about 1.5 cm. l..... 4. L. domingensis.

1. L. patens Urb. Symb. Ant. v. 367 (1908); leaflets glabrous, nerves beneath flat; pedicels spreading, generally longer than the flowers; calyx: teeth wanting, about '4 cm. l.; corolla about 1.2 cm. l.; pod thin-parchmenty, reticulate, glabrescent, somewhat dilated and flat along the upper margin.

In fl. June, in fr. Nov.; near Troy, 2000 ft.; Mulgrave, St. Elizabeth, 1300 ft.; *Harris*! Fl. Jam. 8739, 9065, 12,379.

Straggling trailing shrub, growing to a length of 30 ft. Leaflets in 2-4 pairs, ovate-elliptical, elliptical or oblong, shortly and obtusely acuminate, rounded at the base, papery when dry, 4-9 cm. l. Inflorescence glabrous, lax-flowered, about as long as the leaves. Bracteoles close to the calyx, roundish or ovate-roundish, 1 mm. l. Calyx very sparingly puberulous. more so at the margin. Corolla dark rose-colour; standard roundish, apex deeply emarginate, base auriculate, silvery-silky on the outside, with shallow infolded arricles, 1·2-1·5 cm. l.; wings oblong-elliptical, with hairs along a median line and at the apex, long-clawed, 1·2-1·3 cm. l.; keelpetals oblong-elliptical, cuneate at the base, silvery-silky on the outside, long-clawed, as long as the wings. Pod irregular in outline due to the cessation of growth except around the seeds, beaked with the more or less persistent style, 1-3-seeded, 6-9 cm. l., nearly 2 cm. br. Seeds purplishblack, kidney-shaped, about 1.3 cm. l.

2. L. latifolius H.B. & K. Nov. Gen. & Sp. vi. 383 (in note) (1824); DC. Prodr. ii. 260 (1825); leaflets minutely puberulous beneath, nerves prominent beneath; calyx 5-toothed, 2 upper teeth closer together, 2-2.5 mm. l.; corolla 5-7 mm. l.; pod thin-parchmenty, smooth, minutely puberulous, not sensibly

thickened along the margins.—Griseb. Fl. Br. W. Ind. 199; Benth. in Journ. Proc. Linu. Soc. iv. Suppl. 90; Urb. Symb. Ant. iv. 297; Cook & Collins in Contrib. U.S. Nat. Herb. viii. 178. Amerimnum latifolium Willd. Sp. Pl. iii. 909 (1803). (Fig. 25.)

Dogwood (a name also given to Piscidia piscipula).

In fl. May-July; in fr. Sept.; Wright! Masson! Lindsay! Macfadyen! Wilson; Wullschlaegel; Prior; J.P. 695, Jenman! Castleton Hill, 1000 ft., Thompson! sea-coast, Ferry Pen; near Lacovia; Tyre; Watson's Hill, 1200 ft.; Ipswich, St. Elizabeth; *Harris*! Fl. Jam. 6564, 8032, 9853, 10,812, 11,721, 12,366.—West Indies, continental America from Mexico to Guiana.

Tree 20-50 ft. high. Leaslets in 3 (2-4) pairs, oblong to elliptical, acuminate, cuneate to obtuse at base, papery, jointed to the rhachis, ·5-2 dm. 1. Inflorescence minutely puberulous or glabrescent, shorter than the leaves, 7-12 cm. 1. Bracteoles minute, lanceolate, ·7 mm. 1. Calyx minutely puberulous. Corolla yellow, rosy, or liver-coloured; standard transversely elliptical energy of the coloured is standard. transversely elliptical, apex emarginate, auricles at base obsolete or wanting.

more or less silky on the outside, calli at the base small and only slightly thickened, 5-7 mm. l. (excl. claw), 7-8 mm. br., claw 1 mm. l.; wings oblong-elliptical, slightly curved, glabrous, scarcely auriculate, long-clawed, 4-5 5 mm. l. (excl. claw); claw 2 mm. l.; keel-petals semicircularelliptical, glabrous, 4·5-5 mm. l. (excl. claw), claw 2-2.5 mm. l. Pod not or scarcely constricted between the seeds, style not persisting, 1-4-seeded, 4-9 cm. I., about 2 cm. br. Seeds liver-coloured, kidney-shaped, flat, about 1.2 cm. l., .7 cm. br.

The wood is hard, and is used for furniture in Porto Rico (Cook and

Collins).

3. L. sericeus H. B. & K. Nov. Gen. & Sp. vi. 383 (in note) (1824); DC. Prodr. ii. 260 (1825); leaflets on the lower surface puberulous and with prominent nerves and veins; calyx 3-4 mm, l., teeth obsolete; corolla about 1 · 2 cm. l.—Benth. tom. cit. 88 (excl. vars.); Wilson in Reports Geolog. Jam. 277 (? = L. domingensis). Robinia sericea Poir. Encyc. vi. 226 (1804).

Castleton Garden, J.P. 1099, Morris! also Harris! Mulgrave, St. Elizabeth, 1200 ft.; Harris! Fl. Jam. 9153, 12,356.—Tropical America,

western tropical Africa.

Tree 20-100 ft. Leaflets in 3-5 pairs, elliptical, shortly and abruptly acuminate, rounded and sometimes almost sub-cordate at the base, leathery, upper surface shining, glabrous, 4-8 cm. l.; petioles and petiolules puberulous. Inflorescence brownish-puberulous, nearly as long as the leaves. Bracteoles close to the calyx, round, 1-1-3 mm. 1. Calyx puberulous. Corolla violet-purple; standard roundish, apex emarginate, base auriculate, silvery-silky on the outside, with the lower margin thickened and inflexed, decurrent into the claw, 1·2 cm. l.; wings oblong-elliptical, with hairs along a median line and at apex, slightly curved, long-clawed, 1·2 cm. l.; keel-petals oblong-curved, truncate at the base, silvery-silky on the outside, long-clawed, as long as the wings. Pod woody, smooth, brownish-tomentose, somewhat dilated and flat along the upper margin, linear, the style persisting more or less as a curved beak, 1-5-seeded, 3-13 cm. l., 1.5 cm. br. Seeds purplish-black, oblong-kidneyshaped, about 1.3 cm. l.

4. L. domingensis DC. Prodr. ii. 259 (1825); leaflets glabrous with prominulous nerves and veins beneath; calyx 5-6 mm. l., teeth wanting, rarely obsolete; corolla 1.5-1.7 cm. l.—Urb. tom. cit. 296. L. Turpinii H. B. & K. tom. cit. 385 (1824). L. sericeus var. jamaicensis Griseb. Fl. Br. W. Ind. 200 (1860). L. sericeus H. B. & K. var. glabrescens Benth. loc. cit. & in Fl. Bras. xv. pt. 1, 277 (in part). Dalbergia domingensis Turp. ex Pers. Syn. ii. 276 (1807).

In fl. and fr. July; Wright! Dr. Lindsay! Distin! in rocky places, Manchester, Purdie! road to Troy, 1200 ft., Harris! Fl. Jam. 9491.— Hispaniola, Porto Rico, Guadeloupe, Martinique.

Tree 40-50 ft. high. Leaflets in 3 pairs, elliptical, generally shortly acuminate, 5-15 cm. 1. Racenes axillary, shorter than the leaves, tomentellous or glabrous. Bracteoles small, roundish, 1-1.5 mm. 1. Flowers pale rosy-violet; pedicels usually shorter than the calyx, tomentellous. Calyx strigillose. Corolla pale violet-rose; standard roundish-elliptical, apex deeply emarginate, base truncate, silvery-silky on the outside, with the lower margin thickened and decurrent into the claw, 1.6 cm. l.;

wings oblong, with hairs along a median line and at the apex, upper margin slightly curved, lower somewhat straight, long-clawed, 1.5 cm. l.; keel-petals oblong, upper margin slightly curved, lower straight, truncate at the base, silvery-silky on the outside, long-clawed, as long as the wings. Pod similar to that of L. sericeus, but tomentum shorter, sometimes thickened along both margins, 1-2(3)-seeded, elliptical, oblong, or linear, 3-8 cm. l., 2 cm. br., style more or less persisting as a curved beak.

26. PISCIDIA L.

Tree. Leaves alternate, imparipinnate; leaflets opposite, 3-5 pairs. Flowers appearing before the leaves in panicles. Calyx with 5 short broad teeth. Standard roundish, emarginate;

Dogwood.

Dogwood.
In fl. Feb.-Apr.; in fr. June-Aug.; Sloane Herb. vi. 18! Houstown! Wright! Broughton! Shakspear! Distin! Purdie! March! Prior! King's House, J.P. 1319, Morris! Maiden Cay, Fawcett! near Hope, Campbell! Berwick, 2500 ft.; Hope, 700 ft.; Great Goat Is., 50 ft.; Harris! Fl. Jam. 6502, 7707a, 7708, 8518, 9221.—Florida and Keys, Bahamas, Hispaniola, Porto Rico, St. Thomas, St. Cruz, St. Jan, St. Martin, St. Bartholomew, Antigua, Guadeloupe, St. Lucia, St. Vincent, Barbados, Grenada, Mexico.

Tree 25-30(-60) ft. high. Leaflets elliptical or oblong, minutely puberulous or glabrate on the upper surface, tomentose or minutely puberulous beneath, 4-9 cm. l. Flowers whitish with a purplish tinge, or rosy, produced in large numbers at the ends of the branches. Calyx 5-6 nm. l. Standard 1:3-1:5 cm. l.; wings and keel auriculate, about as long as the standard. Pod 4-8 cm. l.; wing 1-2 cm. br.

Well-grown trees reach a diameter of 2 or 3 feet, and the timber is considered valuable. The wood is of a light brown colour, heavy, tough and elastic; it is used for felloes of wheels, and for cart and carriage frames. It is durable in and out of water, and makes excellent piles for wharves. Posts put into the ground readily grow. "It is largely used in Florida in boat-building and for firewood and charcoal" (Sargent). The whole tree, but especially the bark of the roots, contains piscidin, which is sedative and hypnotic, and has been found effective in producing sleep without subsequent injurious effects. The bark of the root relieves toothache when placed in the hollow of carious teeth. A decoction of the bark of the stem cures mange in dogs. The pounded bark is thrown into streams to intoxicate fish.

27. ANDIRA Lam.

Trees. Leaves alternate, imparipinnate; leaflets opposite. Flowers purplish, sweet-smelling; panicles terminal or subterminal. Calyx truncate with short teeth. Standard roundish. Uppermost stamen free; anthers uniform, versatile. Stigma small, terminal. Pod drupe-like, not opening, pericarp woody. Seed 1, pendulous.

Species 20, natives of tropical America, of which one is also

found in west tropical Africa.

A. inermis H. B. & K. Nov. Gen. & Sp. vi. 385 (in note) (1824); DC. Prodr. ii. 475 (1825); Macf. Jam. i. 323; Griseb. Fl. Br. W. Ind. 202; Benth. in Proc. Linn. Soc. iv. Suppl. 122 & in Fl. Bras. xv. pt. 1, 298, t. 116. A. jamaicensis Urb. Symb.

St. George; near Castleton; Ferry River; Harris! Fl. Jam. 5592, 5902, 8017, 9053.—West Indies, tropical continental America, west Africa.

Tree 25-40(-60) ft. high. Leaflets in 4-7 pairs, oblong, acuminate, glabrous, parchment-like, 5-11 cm. l., 2·5-4 cm. br. Stipules linear, tapering, soon falling, 5 mm. l. Stipels awl-shaped, soon falling, 3 mm. l. Panicle 1·5-3 dm. l.; pyramidal, dense-flowered, much frequented by bees, butterflies, beetles, and humming birds; rhachis, pedicels, and calyx tomentose. Calyx 3 mm. l., dark purple. Corolla reddish-lilac or pale rose; standard emarginate, base truncate, sometimes subcordate, 1 cm. l. incl. the slender claw (2.5 mm. l.); wings and keel about as long as the standard. Pod ellipsoidal, about 3.5 cm. l.

The timber is small but hard and takes a good polish. "The bark of this tree has been employed as a vermifuge. It has a disagreeable smell, and a sweet mucilaginous taste. Its effects are emetic, drastic, purgative, and narcotic. In large doses it is poisonous, producing violent vomiting, with fever and delirium " (Macfadyen).

§ 11. Shrubs or trees. Leaves imparipinnate; leaflets in 4-12 pairs, opposite or nearly opposite. Stamens 10, distinct. Pod 2-valved or not splitting open.

28. SOPHORA L.

Shrub (in West Indies). Leaves imparipinnate; leaflets opposite or nearly opposite. Racemes terminal. Calvx obscurely toothed or with 5 short teeth. Standard elliptical or roundish. Stamens distinct; anthers versatile. Stigma minute, terminal. Pod much constricted between the seeds (necklace-like), manyseeded, not splitting but opening by decay.

Species 25, natives of the tropics.

unequal; anthers versatile. Style with apex folded in; stigma lateral, on the inner side. Pod compressed, thick and leathery, 2-valved. Seeds few, attached by a cartilaginous flexuose stalk.

Species 20, natives of the tropics in America, Asia, and two

species in Africa.

0. jamaicensis Urb. Symb. Ant. v. 366 (1908). (Fig. 29.)

Nickel.

Road from Askenish to Dolphin Head, and on the Dolphin slope,

Harris! Fl. Jam. 9241.

A tall timber tree, with a straight trunk up to 80 ft. in height and over $3\frac{1}{2}$ ft. in diameter; head dense and leafy. Leaflets in 4(-5) pairs, elliptical to oblong-lanceolate, acuminate, base obtuse or acute, 5-11 (12) cm. l., 2-3·5 (4) cm. br.; petiolule 5-6 mm. l. Peduncle 2-2·5 cm. l. fruit-bearing rhachis 6-18 cm. l. Pod glabrous, 1-seded, 4-5 cm. l.; or 2-seded, 6 cm. l. Secds flattened-globose, scarlet with a black ovate-acuminate spot near the attachment, about 1·5 cm. l., and almost as broad, about 1 cm. thick.

"Nickel" is a corruption of "necklace," as the beads are used to make

necklaces.

§ 12. Trees. Leaves imparipinnate, usually reduced to 1 leaflet in the Jamaican species. Calyx closed before flowering, and then bursting into 2-4 irregular segments. Petals 1 in the standard. Stamens numerous, distinct. Pod ellipsoidal or oblong.

30. SWARTZIA Schreb.

Trees. Leaves imparipinnate or reduced to 1 leaflet in S. simplex. Flowers racemose or solitary. Calyx closed before flowering, and then bursting irregularly. Petal 1 (standard), broad, corrugate, the rest wanting, or 2 lateral, very small, sometimes petals altogether wanting. Stamens numerous, distinct, subhypogynous. Pod leathery or fleshy, 2-valved or not opening.

Species 60, natives of tropical America and one of tropical

Africa.

Wilson; March; Bath Garden, J. P. 1011, Morris! Castleton Garden, Harris! Fl. Jam. 8449, 9279.—Dominica, Martinique, St. Vincent, Bequia, Trinidad, Mexico, Guatemala, Costa Rica.

A small tree, 18-20 ft., glabrous. Leaflets lanceolate to elliptical, usually acuminate, 8-14 cm. 1.; petiolules 2-5 mm. 1.; stipules linear,

about 5 mm. 1., soon falling. Racemes axillary, short, laxly 2-4-flowered. Calyx rupturing into 2-4 irregular segments. Standard roundish-kidney-shaped, about 4 cm. in diam. Stanens, 8-12 longer than the rest, with thicker filaments and oblong anthers on the side distant from the standard; the shorter stamens numerous, with thinner filaments, and smallish anthers. Ovary stalked. Pod 1-seeded, ellipsoidal, or 2-seeded,

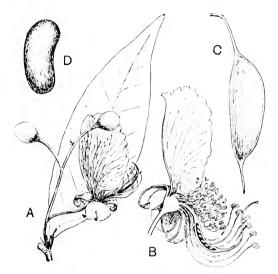

Fig. 20.—Swartzia simplex Spreng.

A, Leaf and inflorescence × ∰. B, Flower cut lengthwise, nat. size. (B after Baillon.)

C, Pod $\times \frac{2}{5}$. D, Seed, nat. size.

oblong, 2.5-5 cm. l., sometimes 3-seeded, constricted between the seeds, 5-10 cm. l., beaked with the persistent style. Seeds about 2 cm. l., kidney-shaped, arillate.

Ūrban divides the species into three varieties: var. α. genuina, leaflets with apex scarcely or shortly acuminate, and roundish or subcordate base, from the W. Indian Is. cited, omitting Jamaica; var. β. jamaicensis, leaflets long acuminate, and acute base, from Jamaica; and var. γ. continentalis, petioles longer and narrowly winged, from Central America.

Subfamily 2, CÆSALPINIE.E.

Flowers irregular or sometimes regular; parts of the flowers generally in 5's. Sepals 5, or the 2 highest united making 4, imbricate. Petals imbricate, the upper within the rest. Stamens 10; anthers versatile. Radicle straight, enclosed within the edge of the cotyledons or shortly exserted. Leaves pinnate or bipinnate; stipels none or very rarely minute.

§ 13. Leaves abruptly bipinnate, or most leaves simply pinnate in Hæmatoxylum, apparently pinnate in Parkinsonia, with an odd pinna in Cæsalpinia coriaria. Calyx 5-cleft. Anthers versatile. Ovary or stalk of ovary free at the base of the calvx-tube: ovules 2 to numerous.

31. PELTOPHORUM Benth.

Trees. Leaves abruptly bipinnate, with 4 pairs of pinnæ in P. Linnei; leaflets numerous. Racemes simple or paniculate, terminal. Calyx 5-cleft; segments unequal. Stamens hairy at the base, 10, free, included. Stigma broad, terminal. Ovules 2 to numerous. Pod broadly oblong, flat, not opening, reticulateveiny in the middle, slightly inflated, thinning to the margin, as it were 2-winged. Seeds few or 1, without endosperm.

Species 10, 4 in tropical America, 2 in Africa, and 4 in the

East Indian archipelago and tropical Australia.

Braziletto.

In fl. in the spring; in fr. in the autumn; Sloane; Houstoun! every part where the soil is dry and rocky, Browne! Wright! Dancer! common and dry limestone districts, Macfadyen! Wilson! Long Mountain Road, 450 ft., Campbell! Sheldon Road; Papine Estate, 800 ft.; Harris! Fl. Jam. 5488, 5439, 6481, 8878.—Central America.

A tree 15-40(-80) ft. high, 8-12 in.(-4 ft.) in diam., without prickles. Leaflets 6-8 pairs, subopposite, elliptical, shining and minutely puberulous on the unprecompted procedures on the midwile procedures.

on the upper surface, puberulous on the midrib on both sides, puberulous or glabrate beneath, margin ciliolulate, 2-4(-5) cm. 1. Racemes axillary or terminal, solitary or clustered, with yellow flowers. Calyx glandular-dotted, 4 segments subequal, irregularly glandular-ciliate, 3-4·5 mm. 1., the 5th segment larger, 6-7 mm. 1., the margin glandular, comb-like. Petals 6-7 cm. 1., 4 subequal, clawed, the 5th not clawed. Pod 6-10 cm. 1., how the state of the segment and the state of the segment and the segmen about 3 cm. br., glabrous, brown, 4-2-seeded.

An excellent timber wood, elastic, tough, durable, and takes a fine polish. It is used for ornamental purposes in cabinet-making, and is well adapted for making the spokes of wheels of carriages. It is of a beautiful orange colour, full of resin, and yields a fine full tincture by infusion.

It was largely exported in Sloane's time for the use of dyers.

Grey Nickar, Bonduc.

Grows with the former species, Sloane Herb. vi. 19! Browne! Wright! Lane! Priestmans River, Deans! Lucea; Blue Mts.; Hitchcock; Luana

Pcint, Harris! Fl. Jam. 9824.—Tropical and subtropical regions.

Shrub climbing by help of prickles; stem diffuse, puberulous-downy, more or less beset with straight unequal prickles. Leaves very large, 3-6 dm. l.; rhachis with recurved prickles; pinnæ in 6-8 (5-9) pairs, 10-15 cm. l.; leaflets in 7 (5) pairs, with 2 hooked prickles at the base of each pair, oblong-ovate, elliptical, or oblong-elliptical, sometimes very shortly or obtusely acuminate, mucronate, base rounded, puberulous on midrib on both sides and on margin, and sometimes all over beneath, membranous or papery, 2-4 (5) cm. l. Racenes long-stalked, dense at apex in bud, somewhat lax lower, with numerous yellow flowers, 1-1 5(-3) dm. 1.; rhachis sometimes prickly; bracts linear-lanceolate, acuminate, 6-12 mm. 1. Calyx about 8 mm. 1, tomentose. Petals oblong, the upper one broader above and shorter, half as long again as the sepals. Stamens shorter than the petals. Ovary often abortive, so that many flowers are male. Pod bright orange brown, 5-7 cm. l., 3-5 cm. br. Seeds 2 or 1 in the pod, subglobose, without endosperm.

Bonduc seeds are regarded in India as tonic and antiperiodic. . . . They have been employed with success in intermittent fevers, especially in those of the natives of India; and also generally in debility and other cases where tonics are necessary. The powdered kernels are either given alone, or combined with chiretta and other Indian tonics, or mixed with powdered black pepper. . . . Dr. Kirkpatrick and other practitioners regard Bonduc root, especially its bark, as more valuable than the seed, in the treatment of intermittents, and for use generally as a tonic. Besides the use of Bonduc seeds in medicine, they are commonly, from their hard and polished nature, strung into necklaces, rosaries, bracelets, &c."— Bentley & Trimen, "Medicinal Plants."

"These nuts are often cast ashore by the sea on the north-west coasts of Ireland and Scotland, and are called Molucca Beans by the inhabitants of the latter."—Sloane (specimens of these are in his fruit collection).

A specimen in Herb. Linn. of a leaf of this species from Browne, named "Zantoxylon clava Herculis" in Solander's hand, is correctly named on

the sheet by J. E. Smith.

§ Pods without prickles.

[C. sepiaria Roxb. Hort. Beng. 32 (1814); prickly scrambling climber; pinnæ in 6–10 pairs; leaflets in 8–12 pairs.—Griseb. op. cit. 205; Bak, tom. cit. 256; Urb. Symb. Ant. ii. 277 & iv. 279.

Wait-a-bit.

Cinchona, Clute! Eggers; near Gordon Town, Ball! Porus, Lloyd; Blue Mts., Port Antonio, Hitchcock.—Naturalized also in Cuba, Hispaniola, Porto Rico, Guadeloupe, Dominica, Martinique, St. Vincent, Barbados, Grenada, Brazil, Africa. Native of India and eastern Asia.

Shrub, climbing high amongst shrubs and trees by means of its prickles

and long trailing branches; branches clothed with grey or brown tomentum, prickly. Leaves 2-3 dm. 1.; leaflets small, oblong, apex rounded, membranous, puberulous, glaucous beneath, 1-2·5 cm. 1.; rhachis with recurved prickles. Racemes simple, stalked, with numerous pale yellow flowers, 1·5-3 dm. 1.; pedicels erect-spreading, about 2 or 3 times as long as the calyx; bracts ovate, acuminate, spreading, soon falling, 8-10 mm. 1. Calyx 9-12 mm. 1. broad saucer-shaped base persisting in the fruit. Petals 12 mm. 1. Stamens slightly longer than the petals; filaments densely woolly below. Pod boat-shaped, with a long beak, persistent and opening wide, 6-8-seeded, 7-10 cm. 1., 3 cm. br.

Makes an impenetrable fence.]

3. C. pulcherrima Sw. Obs. Bot. 166 (1791); erect shrub, scarcely prickly; pinne in 5-10 pairs; leaflets in 8-12 pairs.—Griseb. op. cit. 205; Benth. tom. cit. 67; Bak. tom. cit. 255; Urb. Symb. Barbados Pride, Flower Fence, Wild Senna, Spanish

Carnations.

"Moist grounds and gullies by the Rio Cobra banks near the town of St. Jago de la Vega, &c." Sloane Herb. vi. 25, 26, 27! Houstoun! Broughton! Macfadyen; Lucea, Hitchcock; Porus, Lloyd; Hope Grounds, Harris! Fl. Jam. 8231, 8232.—Bahamas, West Indies, and tropical continental

America, universally cultivated in the tropics.

Shrub or small tree, to 10 or 12 ft. high, glabrous, with only a few scattered prickles on the branches. Leaves 1-3 dm. l. and more; leaflets oblique-oblong, apex rounded, close together, 1-2 cm. l. Racemes showy, terminal, pyramidal, lax, lower pedicels 5-10 cm. l., sometimes also 1 or 2 lateral racemes, with numerous very handsome red-orange or yellow flowers. Calyx, sepals unequal, 10-16 mm. l. Petals roundish, margin crisped, passing into a claw, 2-2 5 cm. l. Filaments red, about 3 times as long as the petals. Pod nearly straight, flat, linear-oblong, somewhat broader at the apex, mucronate, thin, 6-8-seeded, 8-11 cm. l., 1 · 5-2 cm. br.

4. C. vesicaria L. Sp. Pl. 381 (1753); small tree, often prickly; pinnæ in 2-3 pairs; leaflets in 2 pairs.—L. Syst. ed. 10, 1018 & Sp. Pl. ed. 2, 545; Urb. Symb. Ant. ii. 283. C. bijuga Sw. Obs. Bot. 166 (1791); Macf. Jam. i. 329; Griseb. op. cit. 205 (excl. syn. C. glandulosa Bert. and locality Haiti). Sena spuria arborea spinosa...flore luteo &c. Sloane Cat. 149 & Hist. ii. 50, t. 181, f. 2, 3. Cæsalpinia spinosa foliis minoribus &c. Browne Hist. Jam. 227. Poinciana bijugata Jacq. Enum. Pl. Carib. 20 (1760) & Sel. Stirp. Amer. 123. Acacia Bancroftiana Bert. ex DC. Prodr. ii. 473 (1825). Sloane's specimen is in Herb. Mus. Brit. A specimen from Browne named in Solander's hand is in Herb. Linn.

Indian Savin Tree, Bastard Nicarago, Jack Fish Wood.

Passage Fort, and along the road thence to St. Jago de la Vega, Sloane
Herb. vi. 40! Browne! Wright! Shakspear! Bancroft! Macfadyen; Wilson!

Prior; Vere, Husband! Ferry, Campbell! Great Goat Island; Bull Bay; Harris! Fl. Jam. 6226, 9210, 11,858.—Cuba, Curação, Yucatan.

Small tree, 15–20 ft. high, all parts when bruised have a balsamic scent. Leaves 5–10 cm.1.; leaflets obliquely elliptic-obovate or obcordate, unequal-sided at the base, 1·5–3·5 cm. l. Panicle terminal, with numerous yellow flowers. Bracts minute, very soon falling. Calyx: tube 2 mm. l., sepals 4, yellow, 6–7 mm. l., the fifth greenish, 8 mm. l. Petals a little longer than the scpals, unequal, 4-clawed. Stamens a little shorter than the petals. Pod somewhat swollen, succulent, blackish-brown, 3(1–5)-seeded, with partial divisions between the seeds, 3·5–5 cm. l. Seeds more or less roundish-flattened, 7–8 mm. in diam.

5. C. coriaria Willd. Sp. Pl. ii. 532 (1799); small tree without prickles; pinnæ in 4-7 pairs and an odd one; leaflets in 18-28 pairs.—Maef. Jam. i. 330; Watt Dict. Econ. Prod. Ind. ii. 6; Urb. Symb. Ant. ii. 284. Poinciana coriaria Jacq. Sel. Stirp. Amer. 123, t. 175, f. 36 & Ed. pict. t. 260, f. 33. Libidibia coriaria Schlecht. in Linnæa v. 193 (1830); Griseb. op. cit. 206.

Divi-divi, Libi-dibi.

In fl. May and Sept.-Nov. after rains; Liguanea plain, Macfadyen! McNab! Harris!—Bahamas, Cuba, Hispaniola, St. Thomas, St. Cruz, Martinique, Trinidad, Curação, Mexico, Venezuela, Colombia; introduced into India.

Small crooked tree, 15-30 ft. high. Leaves 6-8 cm. l.; leaflets linear-oblong, 5-9 mm. l., 1-2 mm. br. Panicles terminal and axillary, much shorter than the leaves, with numerous crowded fragrant white flowers. Calyx: tube 2.5 mm. l., sepals 3-4 mm. l., recurved. Petals about 4 mm. l., one recurved, lip-like. Stamens longer than the petals, 6-7 mm. l. Pod curled, flat, not splitting open, 6-8-seeded, 3.5-5 cm. l., 2 cm. br.

The pods are rich in tannin, and are used by tanners for the same purposes as sumach. Fermentation occurs in cargoes, due to the presence of the oily seeds, and it has been suggested that an extract might be made locally from fresh pods. Trees in dry districts yield good results; cultivation is not necessary. The pod powdered is astringent, anti-periodic,

and tonic.

C. sappan L. (Sp. Pl. 381), a native of India and the Malay Islands, is cultivated and is perhaps now spontaneous in Jamaica. It is a small tree; leaves 1·5-3 dm. l., pinnæ in 9-12 pairs, leaflets in 10-15 pairs, oblong, very oblique at base, 15-20 mm. l., 7-10 mm. br.; panicles often as long as the leaves; pod oblique, oblong, woody, not opening, 3-4-seeded. The pods are used in India for tanning and dyeing, and the wood for dyeing.

[HÆMATOXYLUM L.

Tree, the wood of which contains a valuable dye. Leaves abruptly pinnate, or bipinnate, the lowest pair of leaflets becoming pinnæ; leaflets in few pairs (2-4). Racemes axillary. Calyx 5-cleft; segments somewhat unequal, very imbricate. Petals small, yellow, narrowly obovate. Stamens hairy at the base. Ovules 2 or 3. Pod flat-compressed, splitting open in the middle of the valves, not at the margins. Seed transversely oblong, without endosperm; hilum ventral.

Species 1, native of central America and Colombia.

H. campechianum L. Sp. Pl. 384 (1753); Sw. Obs. Bot. 170; Wright Mem. 216; Tussac Fl. iv. t. 36; Descourt. Fl. Ant. ii. t. 73; Macf. Jam. i. 332; Griseb. Fl. Br. W. Ind. 204; Bentl. & Trim. Med. Pl. t. 86; Urb. Symb. Ant. iv. 277. H. spinosum &c. Browne Hist. Jam. 221. Lignum campechianum &c. Sloane Cat. 213 & Hist. ii. 183, t. 231, f. 1, 2. Type in Herb. Linn.

Logwood.

Naturalized and spontaneous; Wright! Broughton! Macfadyen; Distin! McNab! Parnell! Wilson! J.P. 1356, Morris! Clute! Morant Bay, Fawcett! Harris! Constant Spring; Port Morant; Lucea; Hitchcock; Porus, Lloyd. Fl. Jam. 8251, 8252.—Bahamas, West Indies, Central America and northern S. America.

A low tree. Leaves alternate or 2–4 together on an aborted branch; leaflets oboyate or obcordate, 1–2·5 cm. l. Racemes usually about as long as the leaf or a little longer, with numerous fragrant flowers, elongating as the pods form. Sepals unequal, purplish, 4·5 mm. l. Petals subequal, 6–7 mm. l. Pod oblong, narrowing to both ends, 2–3-seeded, 3–5 cm. l.

After a hurricane which strips off the leaves, the tree soon bursts into leaf again, and many of the leaves have leaflets enormously increased in

size, becoming about 7 cm. l. and nearly as broad.

The heart-wood is of a dark red or deep purple bronze-tinted colour, and this alone is exported, together with the roots, as a dye-wood, the whitish sapwood being chipped off. Sloane says that "it is cut about the town of Campeche in great quantities, and brought to Jamaica in sloops to be sent into Europe by the traders in Jamaica." Wright states that Dr. Barham introduced the seeds into Jamaica from Honduras about the year 1715. Logwood is a mild astringent. It has been found useful in chronic diarrheea and dysentery, in some forms of atonic dyspepsia, and especially in the diarrheea of infants (Bentley and Trimen). The tree makes a strong fence against cattle.

makes a strong fence against cattle.

"Bastard" Logwood has a much lighter coloured heart-wood, yielding little or no dye. There are no characters of leaf or flower which distinguish it from the true Logwood. It may be considered a physiological species, and trees should be destroyed wherever found. (See Bull. Torr. Bot. Cl.

xxxi. 367.)

[POINCIANA L.

Trees. Leaves abruptly bipinnate; leaflets numerous, small. Flowers handsome, orange or scarlet, corymbose-racemose at the apex of branches. Calyx with 5 nearly equal valvate segments. Petals large, roundish. Stamens hairy at base. Ovules numerous. Pod flat-compressed, hard, with oblique veins, 2-valved, with soft woody tissue between the seeds. Seeds transverse, oblong, with endosperm.

Species 3, natives of tropical eastern Africa, Madagascar,

and the western provinces of India.

P. regia Boj. ms. ex Hook. Bot. May. t. 2884 (1829); Cook & Coll. in Contrib. U.S. Nat. Herb. viii. 223, t. 54; Urb. Symb. Ant. iv. 278; Drake. del Castillo in Grandid. Hist. Madagascar xxx. (Plantes) i. 78.

Poinciana, Flamboyant, Flame Tree.

Cultivated and subspontaneous; yellow-flowered form, Bull Bay, Harris!

cultivated in tropics, native of Madagascar.

Tree 30-40 ft. high. Leaves 2-3 (6) dm. l.; pinnæ in 15 (11-18) pairs, 5-10 cm. l.; leaflets in 12-25 pairs, linear-oblong, 5-8 mm l., glaucous beneath. Raccemes shorter than the leaves, with bright scarlet flowers, very rarely yellow or orange. Sepals 2-3·5 cm. l., 5-8 mm. br. Petals somewhat roundish with long claws, unequal, 4-6 cm. l., 3-4·5 cm. br. Stamens shorter than the petals. Pod 20-50 cm. l., 5-6 cm. br.]

PARKINSONIA L.

Trees. Leaves apparently simply pinnate and clustered, but in fact bipinnate, with a very short petiole; rhachis prolonged above the insertion of the pinnæ into a persistent rigid sharp pointed spine; pinnæ 2 or 4, very long, flattened and with winglike margins, often falling and leaving scars at the base of the spine; leaflets numerous, minute, often falling or abortive: stipules in the form of short curved prickles, often falling and leaving scars at the base of the spine; the axillary branch is sometimes abortive, except that the leaves are developed forming an addition to the primary one. Flowers racemose, yellow. Calvx 5-cleft, segments nearly equal, narrowly imbricate or subvalvate. Petals spreading somewhat unequal, the uppermost Stamens hairy at base. Ovules numerous. Pod narrow, acuminate at both ends, constricted between the seeds. 2-valved. Seeds oblong; embryo with horny endosperm along the sides.

Species 3 or 4, one a native of southern Africa, the rest of tropical and subtropical parts of America, one (*P. aculeata* L.) being now found generally in the tropics.

P. aculeata L. Sp. Pl. 375 (1753); Jacq. Sel. Stirp. Amer. 121, t. 80 & Ed. pict. t. 119; Wright Mem. 267; Descourt. Fl. Ant. i. t. 12; Macf. Jam. i. 334; Griseb. Fl. Br. W. Ind. 204; Sarg. Silv. iii. 89, t. 131. P. aculeata &c. Plum. Nov. Pl. Amer. Gen. 25, t. 3; L. Hort. Cliff. 157, t. 13; Browne Hist. Jam. 222. Specimen in Herb. Linn. named in Solander's hand.

Jerusalem Thorn.

Browne! Wright! cultivated, round Kingston, Broughton! Shakespear Port Royal, McNab! Kingston, Campbell! Hitchcock.—Cultivated and often naturalized in tropical and subtropical regions. Browne states that it was introduced into Jamaica from the mainland, where it is most likely native.

A shrub or small tree 12-30 ft. high. Spines about 3 cm. l. Pinnæ 1·5-3 dm. l.; leaflets linear or oblanceolate, obtuse, 2-6 mm. l. Racemes lax, slender, shorter than the leaves, 12-15 cm. l. Petals about 1·2 cm. l., bright yellow, the upper one with red spots below, imbricate. Stamens much shorter than the petals. Pod 6-12 cm. l., dark orange-brown. Seeds 1-8, distant from one another, about 1 cm. l.]

§ 14. Leaves abruptly pinnate. Calyx 5-cleft, segments imbricate. Petals 5. Anthers basifixed, opening by pores or chinks. Ovary or stalk of the ovary free at the base of the calvx; ovules indefinite. Seeds with endosperm.

33. CASSIA L.

Trees, shrubs or herbs. Leaves abruptly pinnate; leaflets Flowers in racemes, panicles, clusters, or solitary. Calvx 5-cleft, segments imbricate, deciduous. Petals 5, imbricate. subequal or the lower larger, the highest inside the rest. Stamens sometimes 10, all perfect and subequal, or the upper smaller, or the 3 highest very small and imperfect or wanting; anthers basifixed, all similar or those of the lower stamens larger, discharging the pollen by pores or short chinks at the apex, or by pores at the base. Pod cylindrical or flat-compressed, dry or filled with pulp, often with many cells separated by transverse walls.

Species 380, widely dispersed through the tropics, numerous in America from southern Chili to Massachusetts, very many in the whole of Africa, occurring also in tropical Asia and in Australia, but none in Tasmania and New Zealand.

I. Perfect stamens usually 7; the 3 lowest with long curved filaments longer than the petals, and anthers ovate or ellipsoidal not more than 4-6 mm. l., opening by longitudinal chinks; filaments of the 4 or 5 intermediate stamens much shorter, anthers opening by pores at the base; the uppermost 3 or 2 much smaller and usually imperfect. Pod long, smooth and cylindrical, or rough and slightly compressed, hard, not splitting open. Seeds flattened parallel to the tranverse partitions. Glands on leaves wanting.

Leaflets oblong, in 8-20 pairs.

Leaflets rounded at both ends. Pod rough compressed 1. C. grandis.

[Leaflets emarginate, unequal-sided. Pod smooth, cylindrical..... C. marginata. [Leaflets ovate, in 4-8 pairs. Pod smooth, cylindrical... C. fistula.]

II. Perfect stamens usually 7 (10 in C. glauca), the 2 or 3 lowest somewhat longer than the rest; anthers with 1 or 2 pores at the apex, linear, curved, 6-13 mm. l.; staminodes usually 3. Pod cylindrical or compressed, opening at one or both margins, valves not elastic, or more rarely not opening at all.

Leaves glandular at the base of the petiole. Gland tuberculate...... 6. C. occidentalis. Gland cylindrical. Leaflets glabrous 8. C. ligustrina.

Leaflets hairy on both sides 7. C. hirsuta.

100

Leaves glandular between the leaflets. Leaflets broader near the apex.
Leaflets glabrous on the upper side. Leaflets glabrous beneath, 3-5 pairs
7-10 (4-) pairs 12. C. biflora.
Leaflets puberulous beneath, 3(-2) pairs 9. C. tora.
Leaflets puberulous on both sides, 4 (3-5) pairs 10. C. uniflora. Leaflets not broader near the apex.
Leaflets, 2 pairs, acute
Leaflets, 3-5 pairs, oblong, 4-1 cm. l 11. C. bahamensis.
[Leaflets, 6-4 pairs, elliptical, 7-3 cm. l
[Leaflets, 6-4 pairs, elliptical, 7-3 cm. l
Leaves without glands.
[Leaflets obovate C. obovata.]
Leaflets not obovate.
Leaflets large (over 8 cm. l.), oblong. Pod
winged
Leaflets ovate-elliptical. Pod cylindrical 5. C. spectabilis.
Leaflets elliptical, tomentose-soft beneath 14. C. emarginata.
[Leaflets lanceolate-oblong, glabrate beneath $C. siamea.$]
III. Stamens 10, or fewer, all perfect (rarely 2-4 abortive in C. lineata), similar, subequal; anthers linear, opening by short chinks at the apex. Pod flat, linear, elastically 2-valved.

Horse Cassia.

Barham in Hb. Sloane! "Common in lowland woods by the sides of rivulets," Slcane Herb. vi. 21! Houstown! Oersted! Jenman! Priestmans River, Wates! Fl. Jam. 408.—Cuba, Hispaniola, Porto Rico, St. Thomas, St. Cruz, Guadeloupe, St. Vincent, Central America, Colombia, Guiana.

Tree, 40-50 ft. high; the twigs, petioles and inflorescence covered with rusty or white pubescence. Leaves 1·5-2·5 dm. l. Racemes lateral, simple, 1-2 dm. l. Calyx 6-9 mm. l. Petals roundish, 1-1·4 cm. l. Ovary tomentose-villose. Pod 2·5-6 dm. l., about 4 cm. br., inside with transverse partitions, the cells filled with pulp.

The pulp is used like that of *C. fistula*, but is coarser and more powerful. The wood is strong and handsome, and useful for many

purposes.

[C. marginata Roxb. Hort. Beng. 31 (1814); Fl. Ind. ii. 338 (1832); leaflets 10-15 pairs, oblong, apex emarginate, mucronate, unequal at the base, glabrate on upper surface, tomentose beneath, 2-3·5 cm. l.; anthers glabrous; pod cylindrical, somewhat contracted between the seeds.—Griseb. loc. cit.; Benth. in Trans. Linn. Soc. xxvii. 517; Wils. in Reports Geolog. Jam. 277. C. Roxburghii DC. Prodr. ii. 489 (1825); Wight Illustr. t. 83.

Naturalized, Wilson.—India, Ceylon.

A small ornamental tree; twigs, petioles, and inflorescence tomentose. Leaves 1.5-2.5 dm. l. Racemes axillary, somewhat corymbose, much shorter than the leaves, 5-8 cm. l. Calyx 5-6 mm. l. Petals pink or

salmon-coloured, about 1 cm. l. Pod 2-3 dm. l., about 2 cm. in diam., with numerous seeds.

"The heart-wood is heavy, very hard, reddish-brown, small" (Trimen).

[C. fistula L. Sp. Pl. 377 (1753); leaflets 4-8 pairs, very large, 6-14 cm. l., ovate to oblong-elliptical, blunt to subacuminate. glabrous; anthers glabrous; pod cylindrical, smooth.—Wright Mem. 197; Tussac Fl. Ant. iv. t. 2; Descourt. Fl. Ant. ii. t. 125; Macf. Jam. i. 337; Griseb. Fl. Br. W. Ind. 206; Benth. in Fl. Bras. xr. pt. 2, 92 & Trans. Linn. Soc. xxvii. 514; Bentl. & Trim. Med. Pl. t. 87; Urb. Symb. Ant. iv. 272. C. nigra . . . Alexandrina Sloane Cat. 145 & Hist. ii. 42. C. arborea &c. Browne Hist. Jam. 222. Type in Herb. Hermann in Herb. Mus. Brit.; a specimen named by Linneus is in Herb. Linn.

Cassia-stick Tree.

In fl. June, in fr. Jan.; common in gardens and cultivated ground at low elevations; Barham in Herb. Sloane! Sloane Herb. vi. 20. Browne; Wright! Broughton! Macfadyen! Distin!—Tropics, cultivated,

probably native in tropical Asia.

A handsome tree, glabrous, low-growing to 40 or 50 ft. high. Leaves 3 dm. l. or more. Racemes pendulous, lax, generally simple, sometimes branched at the base, as long as the leaves or longer; pedicels 3-6 cm. l. Calyx 6-10 mm. l., soon falling; apex of segments rounded or obtuse. Petals ovate-elliptical or obovate-elliptical, 2-2.5 cm. l., veined, bright yellow, slightly fragrant. Pod 3-6 dm. l., 1.5-2 cm. in. diam.; pulp shining brownish-black in colour and sweet to the taste.

The pulp, fresh from the pod, is agreeable, and is used as a mild laxative in small doses and as a purgative in larger doses. The bark is used in tanning. The heart-wood is extremely hard, and is used for posts,

carts, and agricultural implements.

- II. Perfect stamens usually 7 (10 in C. glauca), the 2 or 3 lowest somewhat longer than the rest; anthers with a simple or double pore at the apex, linear, curved, 6-13 mm. l.; the 3 highest stamens usually imperfect. Pod cylindrical or compressed, opening at one or both margins, valves not elastic, or, more rarely, not opening at all.
- 2. C. viminea L. Syst. ed. 10, 1016 (1759); leaflets, 2 pairs, 2-7 cm. l., obliquely ovate, ovate-lanceolate or ovate-oblong, acute or subacuminate, very unequal at the base, the lower pair shorter than the upper, shining on the upper surface, minutely puberulous or glabrate beneath; gland linear-cylindrical, acute, between the lower pair, and also sometimes between the upper.— L. Amen. v. 397 & Sp. Pl. ed. 2, 537; Sw. Obs. Bot. 156; Macf. Jam. i. 341; Griseb. loc. cit. C. melanocarpa Bert. ex DC. Prodr. ii. 491 (1825); Macf. Jam. i. 338. C. viminea foliis &c. Browne Hist. Jam. 223. Sena spuria tetraphylla &c. Sloane Cat. 149 & Hist. ii. 49, t. 180, f. 6, 7. The type, Browne's specimen, is in Herb. Linn.

In fl. and fr. autumn and winter; Red Hills, Sloane Herb. vi. 31! Wright! Cold Spring, Browne! mountain thickets, Swartz! also Macfadyen; Bancroft! March! Cinchona, J. P. 1112, Hart! Mandeville, Panton! between Abbey Green and Blue Mt. Peak, Hitchcock.—Guiana, northern Brazil.

A trailing shrub rising to 7 or 8 ft. or more, supporting itself on rocks and trees. Stipules long, bristle-like, ·5-1 cm. l. Racemes forming a terminal panicle, leafy at the base, corymbose. Bracts lanceolate, soon falling, about 6 mm. l. Calyx 4-6 mm. l. Petals yellow, showy, puberulous outside, 12-16 mm. l. Pod 3-7 (10) cm. l., cylindrical, black, smooth, apex rounded, apiculate with the persistent style, base rounded, with a short (5 mm.) stalk, "dehiscent along the suture" (Griseb.).

- C. fruticosa Mill. (C. bacillaris Linn. f.) occurs in some of the W. Indian islands, and in tropical continental America, but we have only seen a garden specimen from Jamaica. It differs from C. viminea, especially in the leaflets being larger and semiovate; the flowers being larger, calyx 1 cm. l., petals 2 cm. l., and the pod larger, 2-3 dm. l.
- 3. C. bicapsularis L. Sp. Pl. 376 (1753); leaflets, 3-5 pairs, obovate-elliptical or elliptical-roundish, glabrous, 1·5-3 cm. l., the lower generally smaller than the upper; gland club-shaped between the lowest pair.—Griseb. loc. cit.; Benth. in Fl. Bras. xv. pt. 2, 106 & Trans. Linn. Soc. xxvii. 525; Urb. Symb. Ant. iv. 273. A specimen from Hort. Upsal., named by Linnæus, is in Herb. Linn.

Wright! Lambert! March! Mavis Bank, J. P. 1339, Hart! Port Morant, Port Antonio, Lucea, Hitchcock; Porus, Lloyd; Hector's River, Harris & Britton! Fl. Jam. 10,719.—West Indies, Bermuda, and tropical continental America.

Shrub, 4–10 ft. high, glabrous. Peduncles in the upper axils, as long as, or longer than, the leaves, the highest racemes often forming a terminal panicle. Flowers yellow, variable in size. Calyx 7–8 (10) mm. l. Petals 10–12 (16–18) mm. l. Pod stalked, subcylindrical or slightly inflated, usually straight, 6–15 cm. l., 1–1·5 cm. br., smooth, apex rounded.

4. C. lævigata Willd. Enum. Hort. Berol. 441 (1809); leaflets, 3-4 pairs, ovate-lanceolate, lanceolate, or elliptical, acuminate, 3-7 (8) cm. l.; glands cylindrical or ovoid, pointed, usually between each pair of leaflets.—Collad. Hist. Cass. 89, t. 5; Griseb. loc. cit.; Benth. in Fl. Bras. xv. pt. 2, 108 & Trans. Linn. Soc. xxvii. 527; Urb. Symb. Ant. iv. 273. C. fruticosa erecta foliis plurimis &c. Browne Hist. Jam. 223? Senna occidentalis &c. Sloane Cat. 148 & Hist. ii. 48 (in part).

Sloane Herb. vi. 29*! common about the Angels, Browne; Cinchona, J. P. 601, Hart! Falls River, Prior.—Porto Rico, tropical continental America, tropical west Africa; also in Asia and Australia, probably introduced.

Shrub, 3-6 ft. high, glabrous. Stipules long, soon falling, awl-shaped to linear, 5-8 mm. l. Racenes axillary in the upper axils, the highest forming a terminal corymbose panicle, with yellow flowers. Sepals coloured, 6-10 mm. l. Petals veined, 12-16 mm. l. Pod shortly stalked, cylindrical, splitting along one margin or sometimes not splitting open, beaked with the remains of the style, 6-9 cm. l.

5. C. spectabilis DC. Cat. Hort. Monsp. 90 (1813); leaflets, 4-15 pairs, ovate-elliptical to oblong-elliptical, acute or subacuminate. 3-7.5 cm. l.; glands wanting. — Collad. Hist. Cass. 115, t. 7; Griseb. op. cit. 208; Benth. in Trans. Linn. Soc. xxvii. 529. C. Humboldtiana DC. Prodr. ii. 489 (1825). C. Trinitatis Reichenb, ex DC, Prodr. ii. 489 (1825).

March! gardens, Mandeville, Harris & Britton! Fl. Jam. 10,616 .-

Trinidad, Central America, northern S. America.

Triniad, Central America, northern S. America.

Tree; twigs, inflorescence, and under surface of leaves softly hairy.

Panicle large, terminal, corymbose, with yellow flowers. Sepals 5-7

mm. l. Petals 1·5-2·5 cm. l., 3 upper obovate-elliptical, spreading, 2 lower curved over the centre of the flower, one elliptical, the other falcately oblong. Ovary curved, glabrous. Pod shortly stalked, cylindrical, irregularly constricted between the seeds, to 2·5 dm. l., about 1 cm. br. We doubt whether this species can be considered indigenous.

6. C. occidentalis L. Sp. Pl. 377 (1753); leaflets, 4-6 pairs, ovate-elliptical, ovate-lanceolate or lanceolate, acute or shortly acuminate, oblique at base, 2-7(-9) cm. l. (the lower even as small as 1 cm. l.), glabrous, but margin ciliolulate; gland at the base of the petiole, tuberculate; racemes in the upper axils, shortly stalked, with a few bright orange-yellow flowers close together, the uppermost racemes forming a short panicle.— Collad. Hist. Cass. 107; Descourt. Fl. Ant. ii. t. 135; Macf. Jam. i. 344; Griseb. loc. cit.; Benth. in Trans. Linn. Soc. xxvii. 532. C. falcata L. loc. cit. C. frutescens Mill. Gard. Dict. ed. 8 (1768). C. herbacea major erecta &c. Browne Hist. Jam. 224. Senna occidentalis odore &c. Sloane Cat. 148 & Hist. ii. 48, t. 175, f. 3, 4 (in part). Senna spuria occidentalis &c. Commel. Amst. 51, t. 26. Specimen from Hort. Cliff. in Herb. Mus. Brit.; and one from Browne in Herb. Linn. named by Linnæus.

Stinking Weed, Wild Coffee.

Stinking Weed, Wild Coffee.

Sloane Herb. vi. 30! Tate, Pasmore in Herb. Sloane clxii. 261!

Houstoun! Browne! Wright! waste places, Broughton! Macfadyen! Greenwich, McNab! King's House grounds, J. P. 610, Harris! Gordon Town,

Ball! also Fawcett! Arcadia, Mrs. Sewell! Temple Hall, 700 ft., Thompson! Porus, Lloyd; Manchioneal; Spanish Town; Harris! Fl. Jam.
5999, 6786, 7993.—Tropics, "probably of American origin" (Bentham).

Herb or undershrub, 3-5 ft. high, stinking. Stipules broadly triangular, oblique at base, apex a long acute point, glabrous, very soon dropping off, 7-8 mm. 1. Sepals green or slightly coloured, veined, 6-10 mm. 1. Petals (white when dry) veined, 10-14 mm. 1. Stamens 6 perfect; 3 staminodes with broad blade. Ovary villose. Pod slightly curved, 5·5-12 cm. 1., 6-8 mm. br., at first flat with thickened margins, when ripe thick-compressed with broad margins, glabrous. Seeds "at least in the lower part of the pod, become more or less flattened and parallel with the transverse partitions; in the upper part they are sometimes flattened parallel with partitions; in the upper part they are sometimes flattened parallel with the valves" (Bentham).

The root is diuretic. A decoction of the leaves, taken internally and applied externally, is used as a cure for itch and other cutaneous diseases, also of mange. The seeds are used to destroy ringworm; and, roasted, they are considered to be a substitute for coffee, although analysis has

failed to discover caffein or other alkaloid in them.

- C. sophera L. (Sp. Pl. 379) is reported by Bentham (Trans. Linn. Soc.) from the West Indies, and by Urban (Symb. Ant. vi. 103) from Jamaica, but we have not seen any specimen from Jamaica. The type of this species is in Herb. Hermann in Herb. Mus. Brit.; it has more numerous lanceolate equal-sided leaflets, 4-6 cm. l., and thick cylindrical gland above the base of the petiole, with larger flowers than those of C. occidentalis L. The specimen in Herb. Linn., named in Solander's hand, C. sophera, has very short or tuberculate glands, and we agree with Bentham in thinking that it is not C. sophera L., but probably C. occidentalis L.
- 7. C. hirsuta L. Sp. Pl. 378 (1753); leaflets, 3-5 pairs, ovate or ovate-lanceolate, acute or acutely acuminate, somewhat unequal-sided, villose on both sides, 4-7 cm. l., the lower smaller than the upper; gland above the base of the petiole, cylindrical; racemes axillary or terminal, short, few-flowered. —Griseb. Fl. Br. W. Ind. 209; Benth. in Fl. Bras. xv. pt. 2, 114, t. 34. f. I. & Trans. Linn. Soc. xxvii. 534; Urb. Symb. Ant. vi. 103; Hitchcock in Miss. Bot. Gard. Rep. 1893, 81. C. caracasana Jacq. Hort. Schoenbr. t. 270 (1798).

Port Antonio, *Hitchcock*.—"Carribbean Is.," tropical continental America.

Herb, erect, becoming woody below, 2-3 ft. high, stinking, covered in every part with hairs. Stipules linear-acuminate, sometimes persisting, 7-10 mm. l. Flowers like those of C. occidentalis L. Pod linear, narrow, more or less curved, pubescent, 15-20 cm. l., 4-6 mm. br.

We doubt whether this species is indigenous.

8. C. ligustrina L. Sp. Pl. 378 (1753); leaflets, 6-7 (4-8) pairs, lanceolate, oblong, or oblong-lanceolate, acute, unequal-sided, glabrous, but margin usually ciliolate, 2·5-6 cm. l., the lower smaller than the upper; gland above the base of the petiole, cylindrical to conical sometimes stalked; racemes forming a terminal corymbose panicle of large yellow flowers.—Bot. Reg. t. 109; Bot. Mag. t. 1829; Collad. Hist. Cass. 111; Griseb. op. cit. 208 (excl. syn. C. bahamensis Mill.); Benth. tom. cit. 534. C. fruticosa erecta foliis ovatis &c. Browne Hist. Jam. 223? Senna ligustri folio Dill. Elth. t. 259 (excl. f. 11, 12). Type in Herb. Linn.

Wright! Broughton! Masson! Distin! Charlton, near Ewarton, 1000 ft.; Malvern, 2200 ft.; Harris! Fl. Jam. 6722, 9653.—Bermuda,

Florida, Cuba, Grand Cayman, Hispaniola.

A low shrub, 4-6 ft. high. Stipules linear, leafy, acuminate, very soon falling, about 7 mm. l. Sepals 6-8 mm. l. Petals veined, 1·2-1·5 cm. l. Stamens as in C. occidentalis. Pod flat or the valves slightly convex, glabrous, 7-10 cm. l., about 6 mm. br. Seeds flattened parallel with the valves, numerous, geminate.

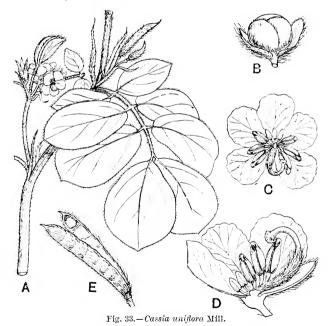

9. C. tora L. Sp. Pl. 376 (1753); leaflets, generally 3 pairs (sometimes 2), obovate-oblong, glaucous, apex very obtuse, mucronulate, glabrous above, puberulous beneath, 2-4 (5) cm. l.; gland cylindrical-pointed, yellow, between the lowest, or the two lowest pairs.—Benth. tom. cit. 535; Urb. Symb. Ant. iv. 274.

C. obtusifolia L. Sp. Pl. 377 (1753); Sw. Obs. Bot. 158; Macf. Jam. i. 341; Griseb. op. cit. 209. C. herbacea major diffusa &c. Browne Hist. Jam. 224. Sena minor herbacea &c. Sloane Cat. 148 & Hist. ii. 47, t. 180, f. 5; Dill. Elth. t. 62, 63. Type in Herb. Hermann in Herb. Mus. Brit. Specimen from Browne in Herb. Linn, named C. tora in Solander's hand.

Common in pastures and waste places; in fl. Sept. and Oct.; St. Jago de la Vega, Sloane Herb. vi. 29! Lane in Herb. Sloane clxii. 261! Browne! Wright! Parnell! pastures, St. Mary, Purdie! Constant Spring, Hitchcock; Porus, Lloyd; Liguanea plain, 500 ft. Campbell! Hectors River, near coast, Harris! Providence, 700 ft., Thompson! Fl. Jam. 5835, 6003, 8055B.—Tropical and subtropical regions.

Annual, undershrub 2-3 ft. high. Stipules linear-awl-shaped, 8-13 mm. l. Flowers bright yellow, long-stalked, in pairs on a very short peduncle in the upper axils, the highest crowded, with shorter stalks. Bracts linearlanceolate, about 5 mm. l. Sepals 6-8 mm. l. Petals 9-11 mm. l. Pod long, to 15 (20) cm. l., 3-6 mm. br., slender, curved or sometimes somewhat straight, slightly 4-angled, smooth. Seeds 20-24, obovaterhomboidal, the longer diameter parallel with the pod, 4 mm. l.

10. C. uniflora Mill. Gard. Dict. ed. 8 (1768) (non Spreng.); leaflets usually 4 (3-5) pairs, obovate or sometimes elliptical,

A. Portion of branch showing leaf, flowers, and young pods $\times \frac{1}{2}$.

B. Calyx in bud \times 2.

C, Flower from above \times 2. D, Part of flower cut through \times 3. E, Pod, nat. size.

mucronulate, the highest larger and unequal at the base, 2-4 cm. l., covered with yellow or reddish hairs on both sides but chiefly beneath and on the margins, gland long, slender, awl-shaped, between the lowest or all the pairs. C. sericea Sw. Prodr. 66 (1788) & Fl. Ind. Occ. 724; Macf. Jam. i. 340; Griseb. op. cit. 209; Beuth. in Fl. Bras. xv. pt. 2, 116, t. 35 & Trans. Linn. Soc. xxvii. 536. C. sensitiva Jacq. Collect. ii. 362 (1788) & Ic. Rar. t. 459. Type in Herb. Mus. Brit. (Fig. 33.)

In pastures; in fl. Aug., Sept.; Wright! "hills of St. Dorothy and St. John," Macfadyen! Distin! Merrywood, Falmouth, Nunes! Luana Point; Long Acre Point, west of Black River; Harris! Fl. Jam. 9927, 9968.—Bahamas, Cuba, tropical continental America.

Annual, woody at base, $\frac{1}{2}$ -2 (4) ft. high; branches petioles and inflorescence bearing yellow or reddish hairs, more or less silky. Stipules linearbristle-like, somewhat persistent, 6-11 mm. l. Flowers yellow, small, subsessile, in very short axillary racemes. Bracts like the stipules; bracteoles lanceolate or bristle-like, to 7 mm. l. Sepals 3.5-5 mm. l. Petals 5-7 mm. l. Pod transversely impressed between the seeds, linear, somewhat four-cornered, straight, erect, crowded 3-6 together on a short stalk, with reddish hairs, 2.5-5 cm. l. Seeds 5-10, somewhat rectangular, the longer diameter parallel with the pod, 3-3.5 mm. l.

11. C. bahamensis Mill. Gard. Dict. ed. 8 (1768); leaflets, 3-5 pairs, oblong, or elliptical-oblong, obtuse, mucronulate, usually glabrous, sometimes with small hairs beneath, unequal-sided, oblique at base, 1-4 cm. l., the lower smaller than the upper; gland tuberculate between the lowest pair of leaflets or rarely below the leaflets; racemes corymbose-paniculate.—Beuth. tom. cit. 541; Hitchcock in Miss. Bot. Gard. Rep. (1893), 80.

Port Morant, Hitchcock.-Bahamas, Florida and Keys. Shrub. Sepals about 7 mm. l., more or less coloured. Petals veined, 9-13 mm. l. Anthers 2 curved, stalked, 4 straight, subsessile. Pod flat, 7-9(-12) cm. l., 6-7(-8) mm. br.

12. C. biflora L. Sp. Pl. 378 (1753); leaflets varying in size even sometimes on the same branch, and also in number, 7-10 (4-13) pairs, elliptical or oblong-elliptical, obtuse, the terminal pair broader at the upper end, larger, and unequal at the base, puberulous beneath and on the margin or glabrate, 2-3.5 cm. l.; gland between the lowest pair and often between the two lowest pairs, cylindrical, sometimes stalked.—L. Amæn. v. 397; Bot. Mag. t. 810; Bot. Reg. t. 1310; Macf. Jam. i. 342; Griseb. op. cit. 208; Benth. in Fl. Bras. sv. pt. 2, 121 & Trans. Linn. Soc. xxvii. 543. C. fruticosa foliis minoribus &c. C. fulgens Macf. loc. cit. A specimen from Browne is in Herb. Linn.

Houstown! woods near Bull Bay, Broughton! Macfadyen! Distin! J.P. 1207 (Herb. Kew.), 2108, Morris! Constant Spring, Hitchcock; West-

phalia Road, 3000 ft.; below Flamstead, 3000 ft.; Harris! Fl. Jam. 6814,

9031.—Bahamas, tropical and subtropical continental America.

Shrub 8–12 ft. high; twigs, petioles, and inflorescence densely puberulous or glabrate. Inflorescence a corymbose-umbellate raceme in the upper axils, sometimes by abortion of leaves paniculate, with 2–4 showy yellow flowers, with long peduncle (2·5–3·5 cm. l.) and pedicels (1·5–1·8 cm. l.); glands 1 or 2, similar to those of the leaf, at base of the pedicels. Bractcoles at base of pedicels lanceolate, 4–5 mm. l., very soon falling. Sepals unequal, 5·5–8 mm. l. Petals unequal, the largest 2–2·3 cm. l., 1·5 cm. br., subsessile, the smallest about $\frac{1}{2}$ as long and $\frac{1}{2}$ as broad with claw 4 mm. l., the rest intermediate. Stamens 3 larger, beaked, 3 or 4 smaller, blunt; staminodes 1–3, with broad blade. Ovary sessile. Pod with a very short stalk on the long pedicel and peduncle, linear, usually slightly curved, compressed, 2-valved, 14–20-seeded, 7–15 cm. l., varying from 4 to 8 mm. br.

13. C. clarendonensis Britton Bull. Torr. Bot. Club xlii. 388 (1915); leaflets 10–15 pairs, elliptical, mucronulate, the uppermost 1 or 2 pairs oblong, 1–2 cm. l.; gland bluntly conical, between the lowest pairs.

Inverness, Clarendon, 200 ft.; cult. Hope Gardens; Harris! Fl. Jam.

11,693, 12,149.

Shrub about 4 ft. high, puberulous all over. Stipules linear-lanceolate, 3 mm. l. Racemes much shorter than the leaves, corymbose-umbellate, in the upper axils, with 2-6 showy yellow flowers. Sepals subequal, 7-9 (5-6 fide Britton) mm. l. Petals subequal, 13-14 (9 fide Britton) mm. l. Stamens 6(-7) fertile, staminodes 4(-3), with broad blade; the 2 long anthers with short beaks. Pod strap-shaped, slightly curved, many-seeded, impressed between pairs of seeds, 9 (7-10) cm. l., 6 mm. br. Seeds about 4 mm. l., ellipsoidal, transverse, puberulous.

14. C. emarginata L. Sp. Pl. 376 (1753); leaflets 3 (2-5) pairs, elliptical, rarely obovate-elliptical, apex rounded or emarginate, puberulous on upper surface, pubescent and soft to the touch beneath, 1·5-6·5 cm. l. (and more); glands wanting.—Sw. Obs. Bot. 157 (excl. syn. Mill.); Wright Mem. 270; Macf. Jam. i. 344; Griseb. op. cit. 207; Benth. in Trans. Linn. Soc. xxvii. 548; Urb. Symb. Ant. iv. 274. C. minor fruticosa hexaphylla senæ foliis Sloane Cat. 146 & Hist. ii. 44, t. 180, f. 1. C. arborescens diffusa &c. Browne Hist. Jam. 223. C. arborescens Mill. Gard. Dict. ed. 8 (1768). Sloane's specimen, the type, is in Herb. Mus. Brit.

Yellow Candle Wood, Senna Tree.

Sloane Herb. vi. 28 (excl. pods and seeds)! Wright! hedges and cultivated places, Broughton! Shakespear! Macfadyen! Savanna near Ferry, Purdie! Oersted! J.P. 1317, Morris! Gordon Town, Ball! Kingston, Hitchcock; Long Mountain road, 300 ft., Campbell! Hope grounds; the Quarry, Spanish Town; Harris! Fl. Jam, 5698, 6933.—Cuba, Hispaniola, Porto Rico, Guadeloupe, St. Vincent, Margarita, Central America, Colombia.

A shrub or small tree, not exceeding 20 ft. in height in Jamaica, but growing elsewhere to a height of 50 ft., puberulous on younger parts. Stipules bristle-like, 3 mm. l. Racemes corymbose, in the upper axils, crowded with the leaves at the ends of the branches, with numerous yellow flowers. Bracteoles at base of pedicels, 4-5 mm. l., soon falling. Sepals unequal in shape and length, 4-6·5 mm. l. Petals stalked, unequal in shape and size, 4 somewhat obovate, 8-10 mm. l., the fifth larger, of a

different form, somewhat S-shaped, concave, with wavy margin, about 15 mm. l. Pod strap-shaped, slightly curved, somewhat swollen along the margins, glabrous, black, many-seeded, 12-25(-35) cm. l., about 1 cm. br. The wood is used for firewood; it is hard but not large enough for general use; it was formerly exported as a dye-wood.

[C. siamea Lam. Encyc. i. 648 (1785); leaflets in 6-10(-14)pairs, lanceolate-oblong to oblong-elliptical, apex rounded or emarginate, mucronulate, glabrous on the upper surface, minutely puberulous or glabrate beneath, somewhat leathery, 3-7 cm. 1.; glands wanting.—Benth. in Trans. Linn. Soc. xxvii. 549; Bak. in Hook. f. Fl. Br. Ind. ii. 264. C. florida Vahl Symb. Bot. iii. 57 (1794); Griseb. op. cit. 208. C. gigantea Bertero ex DC. Prodr. ii. 492 (fide Benth.). C. arborea Macf. Jam. i. 343 (1837).

Macfadyen; Wilson; March; Hope Gardens (cult.), Harris!-

E. Indies and Malaya; introduced in the New World.

A tree, 30 ft. high and more, puberulous on younger parts. Stipules minute (Baker), very soon falling. Racemes corymbose, axillary and forming a terminal paniele, 1.5-3 dm. l., with numerous showy yellow flowers. Bracteoles lanceolate-awl-shaped with lunate lobes about the middle, at base of pedicels, about 6 mm. l. Sepals greenish-yellow, subequal, 5-7 mm. l. Petals stalked, not conspicuously veined, subequal, 12-16 mm. l. Pod strap-shaped, with swollen margins, nearly straight, puberulous or glabrescent, 20(-25) cm. l., 12-14 mm. br.

This species has lately been planted along the streets of Kingston.

15. C. alata L. Sp. Pl. 378 (1753); leaflets 7-8 (6-14) pairs. large, oblong or obovate-oblong, very obtuse, 6-12 cm. l.; petiole triangular; glands wanting.—Sw. Obs. Bot. 162; Wright Mem. 198; Descourt. Fl. Ant. vi. t. 443; Macf. Jam. i. 338; Griseb. op. cit. 209; Benth. in Fl. Bras. xv. pt. 2, 126 & Trans. Linn. Soc. xxvii. 550; Urb. Symb. Ant. iv. 275. C. herpetica Jacq. Obs. Bot. ii. 24, t. 45, f. 2 (1767). C. siliquis quadrialatis &c. Browne Hist. Jam. 224. Juglandis folio, fruticosa &c. Sloane Cat. 153 & Hist. ii. 59. t. 175, f. 2. Herpetica alata Raf. Sylva Tellur. 123 (1838); Cook & Coll. Contrib. U.S. Nat. Herb. viii. pt. 2, 159, t. 39. Specimen from Hort. Cliff. in Herb. Mus. Brit.

Ringworm Shrub.

In fl. Nov.-April; Ferry, Sloane Herb. vi. 15! Ferry and Sixteen Mile Walk, Browne; Swartz; Ferry; Sulphur River, near Bath; Macfadyen; along river-banks, Wullschlaegel; Port Royal; Lucea; Hitchcock; August Town River, 450 ft., Campbell! Halfway Tree, Miss Wood! Ferry River, 200 ft., Harris! Fl. Jam. 6296, 10,045.—Tropics.

A shrub 4-10 ft. high, glabrous. Stipules obliquely dilated at the base, acute or acuminate, 4-12 mm. l. Racemes in the upper axils or at the ends of branches, buds overlapping and forming a short cone but lengthening during flowering to 3 dm. and more. Bractcoles large, elliptical, orange-coloured, enclosing the stalked flower-bud, 2-2.5 cm. l., deciduous. Sepals orange-coloured, somewhat unequal, 13-14 mm. l. Petals yelloworange, stalked, broader at the apex, veined, 15-20 mm. l. Pod, before opening, as it were 4-winged, by the development of a broad longitudinal wing in the middle of each valve, 10-15 cm. l., 1.5 cm. br. Seeds 4-cornered, compressed in the narrow transverse cells, about 7 mm. l.

"The juice of the leaves and buds has been employed in the cure of ringworm, and other cutaneous diseases. The infusion has been used, as a tepid bath, in similar cases. The flowers and young leaves, beat into a pulp, make an excellent poultice for the superficial sores which follow some varieties of impetigo and rupia " (Macfadyen).

[C. obovata Collad. Hist. Cass. 92, t. 15A (1816); leaflets in 3-7 pairs, obovate or oblong to oblanceolate-oblong or obovateelliptical, apex broadly rounded, mucronulate, 1-4 cm. l.; glands wanting.—Macf. Jam. i. 340; Griseb. op. cit. 209; Oliv. in Fl. Trop. Afr. ii. 277; Benth. in Trans. Linn. Soc. xxvii. 553; Bentl. & Trim. Med. Pl. t. 89. C. Senna L. Sp. Pl. 377 (1753) (in part); Sw. Obs. Bot. 161; Wright Mem. 197. C. ligustrina Mill. Gard. Dict. ed. 8 (1768) (non L.). Senna italica &c. Sloane Cat. 148 & Hist. ii. 47. S. italica Mill. Gard. Dict. ed. 8 (1768).

Palisadoes near Port Royal, also cultivated, Sloane Herb. vi. 23, 24! Wright; Bancroft! Macfadyen! Grabham!—West Indies (introduced).

Tropical and southern Africa and western Asia to India.

Herbaceous, erect, 1-2 (4) ft. high, glaucous, glabrous, nearly puberulous. Stipules lanceolate, acuminate, persistent, 4-6 mm. l. Racemes axillary, generally longer than the leaves, many-flowered. Bracts 4-7 mm. l., soon falling. Sepals subequal, about 8 mm. l. Petals subequal, bright yellow, veined, about 1 cm. 1. Pod flat, much compressed, rounded at both ends, curved, with a series of crests in the middle of the valves, one over each seed, 3-6 cm. l., 1.5-2 cm. br.

The leaflets of this species mixed with the leaflets of C. lanceolata, are known as Alexandrian Senna, and both species are official in the British

Pharmacopæia.]

[C. glauca Lam. Encyc. i. 647 (1785); leaflets in 6-4 pairs, elliptical, apex rounded or obtuse, glaucous and puberulous or glabrescent beneath, 3-7 cm. l.; glands ovoid or cylindrical between the lower pairs of leaflets.—Griseb. op. cit. 208; Benth. in Trans. Linn. Soc. xxvii. 555; Bak. in Hook. f. Fl. Brit. Ind. ii. 265.

Distin! March!—West Indies (introduced), native of E. Indies, Malaya, tropical Australia, Polynesia.

A tree. Stipules curved, linear, 7-8 mm. l. Racemes axillary, corymbose, long-stalked, with large bright-yellow flowers. Bracts at base of the pedicels, oblong-acute, about 6 mm. l. Sepals yellowish, obtuse, 5-10 mm. l. Petals elliptical, 2-3 cm. l. Stamens 10 fertile, subequal. Pod flat, thin, straight, strap-shaped, glabrous, 1-1.5 dm. l., 13-17 mm. br.]

- III. Stamens 10 or fewer, all perfect (rarely 2-4 abortive in C. lineata), similar, subequal; anthers linear, opening by short chinks at the apex. Pod flat, linear, elastically 2-valved.
 - 1. Flowers in racemes, which are terminal and sometimes with solitary flowers in the upper axils. Plant viscose. Leaflets 2 pairs. Glands none or minute between the pairs.
- 16. C. Absus L. Sp. Pl. 376 (1753); Jacq. Eclogæ Pl. Rar. i. t. 53; Griseb. op. cit. 210; Benth. in. Trans. Linn. Soc. xxvii. 558.

C. viscosa Macf. Jam. i. 345 (non H. B. & K.). The type is in Herb. Hermann in Herb. Mus. Brit.

In hedges at Rock Fort, Broughton! Liguanea, Macfadyen! King's House grounds, Harris! Fl. Jam. 6907.—Tropics of Old World, Mexico, Bolivia.

Stem a much branched erect annual, 1–2 ft. high; stem and petioles with glandular viscid hairs. Leaves 5–7 cm. 1.; leaflets elliptical, oblique, glabrous on the upper surface, puberulous beneath, at length glabrescent, 2–3 cm. 1.; petiole long, 2–4 cm. 1.; stipules small, lanceolate, 3–3·5 mm. 1. Bracts lanceolate, about 2·5 mm. 1. at base of raceme, ovate, about 2 mm. 1. at base of pedicel; bracteoles 2, minute, very caducous, in middle of pedicel. Calyx 3·5–5 mm. 1., somewhat hirsute or puberulous. Corolla 5–7 mm. 1., yellow. Stamens 5 (7). Pod linear-oblong, sparsely covered with bristly hairs, margined, 2·5–4 cm. 1., 6–7 mm. br., 6–7-seeded. Seeds black, obovate-rhomboidal, 3·5–4 mm. 1.

- 2. Pedicels solitary, in pairs, or in clusters, springing from a peduncle which is more or less adherent to the stem for some distance above the axil, so that the pedicels are supra-axillary.
- 17. C. rotundifolia Pers. Syn. i. 456 (1805); leaflets 1 pair, roundish or obovate-elliptical, very oblique, 6-18 (24) mm. l., membranous, without a gland.—Griseb. op. cit. 210; Benth. in Fl. Bras. xv. pt. 2, 161 & Trans. Linn. Soc. xxvii. 570. C. bifoliolata DC. ex Collad. Hist. Cass. 120, t. 9, B.

Agualta Vale, St. Mary, McNab!—Tropical continental America. Stem prostrate, 1–1 $\frac{1}{2}$ ft. long, woody below, more or less puberulous, much branched from below. Leaflets: base semicordate, apex rounded, without a mucro, midrib exmedian,* nerves 4 or 5 from the base, pinnate, prominulous beneath, margin ciliolulate, otherwise glabrous; petiole hairy, 3–5 mm. l.; stipules ovate, cordate, ribbed, base oblique, mucronate, ciliolulate, 5–7 mm. l. Pedicels solitary, slightly above the axils, longer than the leaves, 1·5–2·5 cm. l. Bracts and bracteoles lanceolate, acuminate, bristly above, 1–1·5 mm. l. Calyx villose, 3·5–4 mm. l. Corolla a little longer than the calyx, 4–5 mm. l. Pod margined, puberulous, 7–8-seeded, 1·5–3 cm. l., 4 mm. br.

- 18. C. pilosa L. Syst. ed. 10, 1017 (1759); leaflets, 2-5 pairs, oblong, 10-25 mm. 1., membranous, without a gland.—L. Amen. v. 378 & Sp. Pl. ed. 2, 540; Sw. Obs. Bot. 160; Collad. Cass. 122, t. 20, A; Macf. Jam. i. 347; Griseb. op. cit. 210; Benth. in Trans. Linn. Soc. xxvii. 570. C. emarginata Mill. Gard. Dict. ed. 8 (1768) (non L.). C. Milleri Collad. Cass. 132 (1816). C. mimosioides Wright Mem. 271 (1828) (non L.). C. suffruticosa erecta hirsuta &c. Browne Hist. Jam. 224? (excl. syn. L. & Sloane). The type, Browne's specimen, is in Herb. Linn.
- * When the midrib is in the middle of the leaf, it is median, about halfway between the middle and the margin exmedian, nearer the margin than the exmedian position marginal.

In fl. Sept.-Dec.; Houstoun! Browne! Liguanea, Broughton! Distin! "common in cane-piece intervals," Macfadyen! Agualta Vale, McNab! Kingston, Prior! Wullschlaegel; Castleton, Morris! Constant Spring, Hitchcock; King's House grounds; Bull Head, 2500-2880; Harris! Golden Spring. Thompson! Fl. Jam. 6906, 8051, 12,268.—Columbia.

Stem somewhat shrubby; branches spreading, ascending, reddish, villose, 1-4 ft. long, seldom rising higher than 2½ ft. Leaves 2-5 cm. l.; leaflets 3-6 mm. br., base oblique, semicordate, apex obtuse, mucronulate, midrib exmedian, nerves prominent on both sides, margin ciliolate, otherwise usually glabrous, 4-7 mm. br.; petiole (3-5 mm. l.) and rhachis villose; stipules ovate, apex acuminate-setose, semicordate at the base, ribbed, ciliate, 10-13 mm. l. Pedicels 1-2 (4), as long as, or longer than, the leaves, 2-4 cm. l. in flower, somewhat longer in fruit, arising slightly above the axil. Bracts lanceolate, 5 mm. l.; bracteoles awl-shaped, 2·5 mm. l. Sepals sparsely villose, 5 mm. l. Petals yellow, a little longer than sepals, 6-7 mm. l. Pod margined, puberulous, 9-13-seeded, 2-3·5 cm. l., 4 mm. br. Seeds somewhat rectangular, buff-coloured, 2·2 mm. l.

According to Swartz there are very minute stalked glands under the

lowest leaflets.

19. C. serpens L. Syst. ed. 10, 1018; leaflets, 5-7 (4-9) pairs, oblong-linear, somewhat oblanceolate, 6-8 (4) mm. l., membranous, with a small flat circular long-stalked gland below the leaflets.—L. Amæn. v. 378 & Sp. Pl. ed. 2, 541; Sw. Obs. Bot. 161; Griseb. loc. cit.; Benth. in Trans. Linn. Soc. xxvii. 570 & in Fl. Bras. xv. pt. 2, 162. C. flexuosa Miller Gard. Dict. ed. 8 (non L.). C. prostrata Humb. & Bonpl. in Willd. Enum. Hort. Berol. (1809). C. pygmæa Macf. Jam. i. 348 (1837) (non DC.). C. herbacea tenuissima &c. Browne Hist. Jam. 225 (excl. syn. L.). [Senna occidentalis] Eadem floribus pediculis longioribus insidentibus Sloane Hist. ii. 51. The type, Brown's specimen, is in Herb. Linn., the name in Solander's hand.

Sloane Herb. vi. 34, 35! Houstoun! Browne! Swartz! Macfadyen! St. Andrew, McNab! Liguanea plain, Campbell! King's House grounds, Harris! Fl. Jam. 6020, 6911.—Cuba, Central America, tropical S. America.

Stems slender, prostrate, glabrous or puberulous, to 1½ ft. long. Leaves 1-3 cm. 1.; leaflets mucronulate, somewhat oblique at base, apex rounded, obscurely denticulate, glabrous, midrib exmedian, nerves 2-3 from base, pinnate on broad side, prominulous on both faces; petiole hirsute below, 2-4 mm. 1., rhachis glabrous; stipules narrowly lanceolate, long acuminate, 4-6 mm. 1. Bracts awl-shaped from a broad base, 2·5-3 mm. 1.; bracteoles 2-2·5 mm. 1. Pedicels 1·5-2·5 cm. 1., solitary or rarely 2, on an almost suppressed peduncle. Flowers yellow, generally small. Sepals 4·5 mm. 1. Corolla: petals 4-6 mm. 1., sometimes twice as large. Pod oblong-linear, slightly margined, 5-10-seeded, pubescent with a few long weak hairs, 1·5-2·5 cm. 1., 3-4 mm. br. Seeds somewhat rectangular, about 3 mm. 1.

20. C. lineata Sw. Prodr. 66 (1788); leaflets, 2-5 (9) pairs, oblong, somewhat broader at the apex, tomentose beneath, 9-16 mm. l., leathery, with a solitary round flat or very short cylindrical sessile gland below the leaflets.—Sw. Fl. Ind. Occ.

726; Macf. Jam. i. 349; Griseb. loc. cit.; Benth. in Trans. Linn. Soc. xxvii. 572. C. suffruticosa et subhirsuta &c. Browne Hist. Jam. 225? Type in Herb. Mus. Brit.

Very common about the upper parts of Liguanea, Browne; waste places, Swartz! Purdie! Malvern, 2200 ft.; Lititz savanna, 300-900 ft.;

Harris! Fl. Jam. 9652, 11,725.—Bahamas, Cuba.

"A dense shrub, 3 ft. high," or "a straggling shrub, up to 6 ft. high" (Harris); "an undershrub, 1-3 ft. high" (Swartz); branches puberulous. Leaves 1.5-2 cm. 1.; leaflets, apex rounded or truncate, mucronulate, base oblique, midrib nearly median, nerves 2-3 on the broad side from base, 1-2 on the narrow side, pinnate, prominent beneath, glabrous on the upper surface, puberulous and soft to the touch beneath; petiole (and rhachis) pubescent, 3-4 mm. l.; stipules lanceolate, acute or acuminate, ciliolate, 3-5 mm. i. Pedicels solitary or 2 or 3 in clusters, axillary and shortly above the axil, '5-2 cm. l. *Bracts* lanceolate, 2-3 mm. l.; bracteoles lanceolate, close below the flower, 2 mm. l. *Calyx* more or less pubescent, 8-10 mm. l. Corolla yellow; petals subequal, 1.5 cm. l. Stamens 9-10. Pod oblong, slightly curved, narrowed to the base, margined, pubescent or glabrescent, 3-4 cm. 1. Seeds 10-12, somewhat rectangular.

21. C. polyadena DC. Pl. Rar. Jard. Genèv. 2e Rapp. 12 (1824); leaflets, 4-8 pairs, oblong or somewhat obovate-oblong, 1.5-2.5 cm. l., leathery; glands capitate, subsessile or longstalked, one below the leaflets and often others along the rhachis. - Griseb. op. cit. 210; Benth. in Trans. Linn. Soc. xxvii. 575. C. chamæcrista L. Sp. Pl. 379 (in part i.e. as concerns the habitat Jamaica). Senna occidentalis siliqua multiplici &c. Sloane Cat. 149 & Hist. ii. 51. Browne! ditches and wet places near Kingston, Broughton! Swartz! Macfadyen! McNab! Port Royal Mts., Hartweg! St. Thomas, Purdie! Oersted! March! Gordon Town, Ball! J.P. 1197, Morris!

Stem shrubby, erect, 2-3 ft. high; branches puberulous or glabrate. Leaves 3-9 cm. 1.; leaflets oblong-linear to sublanceolate, mucronulate, base oblique, nerves 3-4 from the base, pinnate, prominent, on the upper side not so distinctly prominent; puberulous or glabrescent beneath, glabrous above, 8-20 mm. l., 2-4.5 mm. br.; petiole (and rhachis) pubescent, 2 mm. l.; stipules lanceolate, long acuminate, 5-8 mm. l. Pedicels solitary or 2 or 3 together, above the axils, 5-2 cm. l. Bracts triangular, acuminate, ribbed, 3-4 mm. l.; bracteoles lanceolate or linearlanceolate, 2-4 mm. l. Sepals more or less puberulous along a median line. Petals yellow. Stamens 10, 2 longer than the rest. Pod oblonglinear, 3-4 cm. l. Seeds somewhat square-shaped, dirty brown, about 2.5 mm. in diam.

"A decoction of the roots of the Cane-piece Sensitive Plant is an antidote against vegetable and fish poisons. A handful of the washed roots being boiled in water from three pints to two, may be strained, sweetened, and used for common drink, at the rate of three quarts in twenty-four

hours" (Wright).

23. C. Broughtonii Fawc. & Rendle in Journ. Bot. lv. 37 (1917); leaves 7-11 cm. l.; leaflets, 19-22 (26) pairs, midrib nearly median, nerves few, distant; gland campanulate, long-stalked, below the leaflets; sepals 7–8 mm. l.; corolla not longer, petals 6-8 mm, l.; pod strongly margined, villose, about 16-seeded.

"In fossis et udis," Broughton! Macfadyen! King's House grounds, 600 ft.; Harris! Fl. Jam. 6949.—Types in Herb. Mus. Brit., Herb. Kew.,

Herb. Jam., and Broughton's collection.

Shrub, 3 ft. high; young branches densely pubescent with curved hairs. Leaflets oblong-linear, oblique at base, scarcely so at apex, base of broad side rounded, midrib ending in a bristle-like mucro, nerves 3-4 from the base, pinnate on the broad side, obsolete or slightly prominulous on the upper surface, prominulous beneath, margin ciliolulate, upper surface glabrous, lower glabrescent, 14-18 mm. 1., 2-2.5 mm. br.; petiole (and rhachis) pubescent, 5-8 mm. 1.; stipules lanceolate, acuminate, ribbed, ciliate, 13-14 mm. 1. Pedicels 2 or 3 in axillary and supra-axillary clusters, 5–7 mm. l. Bracts ribbed, 5 mm. l.; bracteoles ribbed, 3 mm. l. Sepals pubescent. Corollà yellow. Stamens 9, 2 longer than the rest. Pod oblong-linear, 4·5–5 (2·5) cm. l., 4·5 mm. br.

24. C. nictitans L. Sp. Pl. 380 (1753); leaves 2.5-4 cm. l.; leaflets, usually 10-16 pairs, midrib submedian, nerves few beneath; gland saucer-shaped or flat and round, shortly stalked, below the leaflets; sepals 4-5 mm. l.; petals 4 not longer than sepals, one longer, 5.5-7 mm. l.; stamens usually 5 (4-6); pod

pubescent, $3 \cdot 5 - 4 \cdot 5$ cm. l.—Griseb. op. cit. 211 (in part); Benth. tom. cit. 578 (in part). Senna occidentalis siliqua singulari &c. Sloane Cat. 150 & Hist. ii. 51. Type in Herb. Linn.

Savanna, St. Jago de la Vega, Sloane Herb. vi. 33 & viii. 135 (6)!

Broughton! Distin! Manchester, Purdie! Porus, Lloyd.

Siem puberulous above with curved hairs, glabrescent below. Leaflets oblong-linear, nerves pinnate, 2-3 from the base, prominent beneath, apex obtuse, mucronate, pubescent in young state, at length glabrate, margin ciliate, 7-14 (17) mm. l., 2-2·2 (1-3) mm. br.; petiole (and rhachis) puberulous; stipules lanceolate with long acuminate bristle-like point, ciliolate on margin, 7-8 mm. l., longer than to the insertion of the gland. Pedicels 1-3 in clusters, 1-10 mm. above the axil, 2-5 mm. l. Braets 2-4 mm. l., ribbed; bracteoles 1·2-2·5 mm. l. Sepals 4-5 mm. l.

25. C. patellaria DC. ex Collad. Hist. Cass. 125, t. 16 (1816); leaves 5-6 cm. l.; leaflets, 18-20 (10-25) pairs, midrib nearer the margin than the middle, nerves several, parallel; gland 1 or sometimes 2, sessile, flat, round, below the leaflets; sepals 5-6 mm. l.; petals not longer than the sepals; stamens 7-8; pod villose, 2·5-3·5 cm. l.—Griseb. op. cit. 211; Benth. tom. cit. 578.

Guys Hill, St. Thomas in the Vale, MeNab! pastures, St. Mary, Purdie! Wilson! Robertsfield, Faweett!—Cuba, Tobago, Trinidad, tropical conti-

nental America.

Stem to 3 ft., erect, densely pubescent or puberulous with curved hairs or villose. Leaflets oblong-linear, ending in a mucro, nerves 4-5 from the base, pinnate otherwise, prominent, very oblique both at base and apex, base of the broad side truncate, margin ciliolate, upper surface puberulous with adpressed hairs, or glabrate, lower puberulous with adpressed hairs, 10–15 mm. l., 2–3 mm. br.; petioles (and rhachis) villose; stipules lanceolate, acuminate, puberulous, ciliate, 9–12 mm. l. Peduncle giving off 1 or 2 erect clusters of flowers at intervals of about 5 mm. above the axil, each cluster of 2–4 flowers. Bracts ribbed, 4–6 mm. l.; bracteoles ribbed, 2·5–3 mm. l. Pistil villose. Pod oblong-linear, compressed, margined, 6–10-seeded. Seeds somewhat square, about 2 mm. l.

26. C. fasciata comb. nov.; leaves 7-9 cm. l.; leaflets, 10-22 pairs, midrib exmedian, nerves few beneath curved outwards along the margin; gland 1, rarely 2, cup-shaped, sessile, below the leaflets; sepals 8-8.5 mm. l.; petals, 3 longer than the sepals, 13-9.5 mm. l.; stamens 10; pod somewhat hirsute, 4-5 cm. l.—C. chamæcrista Macf. Jam. i. 346 (1837) (non L.). C. nictitans Griseb. loc. cit. (1860) (in part); Benth. tom. cit. 578 (in part) (non L.). Chamæcrista fasciata Britton in Bull. Torr. Bot. Ant. xxxvii. 352 (1910).

Wright! "Cane-piece intervals in seasonable districts," Macfadyen; between Bath and Cuna-cuna Pass, 1000 ft., Britton, 3500! bed of river,

Morant Bay, Harris & Britton! Fl. Jam. 10,641.

Herbaceous, roots apparently annual. Stems erect, little branched, 1½-3 ft. high, more or less pubescent with curved hairs. Leaflets oblonglinear, glabrous, apex obtuse or acute, mucronate, base oblique, rounded on the broad side; nerves 2-3 from the base, otherwise pinnate, prominent beneath; margins somewhat serrulate, 1-1·5 cm. l., 2-2·5 mm. br.; petiole

5-8 mm. l. (and rhachis), with curved hairs; stipules lanceolate, acuminate, ciliolulate, ribbed, 8-10 mm. l. Pedicels 5-8 mm. l., villose, in clusters of 3 or 4, springing from a point 1-1 5 cm. above the axil. Bracts ovate acuminate, about 4 mm. l.; bracteoles ovate-lanceolate, 3-3 5 mm. l. Pod linear, slightly curved, somewhat narrowed towards the base, margined. 9-12-seeded.

27. C. smaragdina Macf. Jam. i. 347; leaves 2-4 cm. l.; leaflets, 8-13 pairs, midrib submedian, nerves somewhat few but closer together and straighter and more upright than in C. fasciata; gland 1, cup-shaped, sessile, below the leaflets; sepals 7-8.5 mm. l.; petals, 2 or 3 longer than the sepals, 10-9 mm. l., the rest about 7 mm. l.; stamens 10; pod puberulous, 3-3 5 cm. l.

"Common in the mountain districts; in flower the greater part of the year," Macfadyen; Cinchona, J.P. 1258, Hart!—Hispaniola.

Stem puberulous with curved hairs. Leaflets oblong-linear, nerves pinnate, 3-4 from the base, prominent beneath, apex obtuse mucronate, glabrous on upper surface, puberulous beneath or glabrate, margin ciliolulate, 6-10 mm. l., 2 mm. br.; petiole (and rhachis) puberulous; stipules lanceolate with long acuminate bristle-like point, ciliolate on the margin, 6-10 mm. l. Pedicels solitary or 2-4 together, 2-10 mm. above the axil. 3-8 mm. l. Bracts ovate, with a long acuminate bristle-like point, ribbed, 4-6 mm. l.; bracteoles like the bracts but narrower, 3-5 mm. l. Pod 9-12-seeded.

Macfadyen gave the specific name (emerald-like) "from the beautiful

bright green of the leaflets."

§ 15. Leaves composed of two leaflets united. Calyx spathaceous, 5-toothed. Petals 5. Anthers versatile. Stalk of the ovary free or adherent to the tube of the calvx; ovules 2 or more. Seeds with endosperm.

34. BAUHINIA L.

Trees or shrubs. Leaves (in Jamaican species) composed of two leaflets united. Flowers in racemes, or 2-3 together, or solitary. Receptacle (calyx-tube) cylindrical. Calyx spathaceous, 5-toothed. Petals 5, subequal. Stamens, 1 fertile, or 10 fertile in B. tomentosa. Pod 2-valved, splitting open.

Species about 250, widely dispersed within the tropics.

Petals 1.5-2.5 cm. l. Stamens, 1 fertile..... B. divaricata.

B. divarieata L. Sp. Pl. 374 (1753); petals $1 \cdot 2 - 2 \cdot 5$ cm. l., 3-6 mm. br., white changing to rose-pink; stamens, 1 fertile, much longer than the rest.—L. Sp. Jerusalem Date, Butterfly Flower.

Common in gardens and fences; St. George, Watt! Ramble, Hanover. Fawcett! Lucea, Hitchcock; Hope Gardens, Harris! Fl. Jam. 12,337.— Cultivated, and, as it were, spontaneous in Jamaica and other West Indian

islands, probably native in Guiana.

Shrub or small tree, 12-16 ft. high. Leaves 11-13-nerved, base truncate or shallow-cordate, 5-16 cm. l. and br.; leaflets united $\frac{1}{2}$ - $\frac{2}{3}$ of their length, glabrous on the upper surface, puberulous on the nerves beneath. Raceme tew-flowered, somewhat corymbose. Pedicels about 3 cm. l., densely puberulous. Flowers hermaphrodite, or with ovary abortive. Receptacle about 3.5 cm. l., 3 mm. br. above, densely puberulous. Calyx tomentellous, with the points free, mucronate or dentate, about 2 cm. 1. Petals obovate, clawed. Stamens, one fertile, 4-4.5 cm. l., the rest all sterile, 10-2 mm. l., 5 free, the rest more or less united. Pistil, stalk 2-3 cm. l., adherent to the receptacle, the free part about as long as the fertile stamen, in male flowers 4-5 mm. l.; ovary puberulous, at length glabrate. Pod generally only one in a raceme, broadly linear, straight, 18-22 cm. l., about 2.5 cm. br., with a short beak (style) 1-1.5 cm. l. Seeds 16-22, separated by a flocculent pithy substance, flattened-ellipsoidal, 10-12 mm. l., 6-8 mm. br.

"There are miles of this species used as a roadside fence plant in St. Mary. The trees are pollarded, and they then produce long pliable branches which make a good wattle fence when properly plaited" (Harris).]

[B. tomentosa L. Sp. Pl. 375 (1753); petals 4-5 cm. l., golden yellow with a deep purple blotch at the base of the upper one; stamens 10 fertile.—Hook. f. in Bot. Mag. t. 5560; Bak. in Hook. f. Fl. Brit. Ind. ii. 275; Urb. in Jahrb. Bot. Gart. Berl. iv. 251 & Symb. Ant. iv. 271. B. pubescens DC. Lég. Mém. 483 (1825) (fide Urb.). B. ungula Griseb. Fl. Br. W. Tamarindus Sloane Cat. 147 & Hist. ii. 45; Browne Hist. Jam. 125. Type in Herb. Linn.

Tamarind.

Cultivated; Houstoun! Wright! Macfadyen; Constant Spring, Hitch-cock; Porus, Lloyd; Berwick, 2000 ft., Harris! Brandon Hill, 1200 ft., Thompson! Fl. Jam. 6535, 8084.—For distribution, see under genus.

A large tree without prickles, usually to 30 or 40 ft. high, but in the open plains often a very large tree with a diameter of 5 ft. Leaflets in 8-20 pairs, oblong, apex rounded, base unequal-sided, about 2 cm. l. Bracteoles boat-shaped enclosing the bud, soon falling, about 11 mm. l. Petals about as long as the calyx, white or pale yellow with red veins, nearly 1.5 cm. l. Pod 7-15 cm. l., 2.5 cm. br. Seeds 2-8.

The pulp of West Indian Tamarinds is official in the British Pharma-

The pulp of West Indian Lamarinus is official in the British Lamarina-copeia and in that of the United States. The wood is yellowish-white, hard and close-grained; heart-wood small, dark purplish brown. The timber is highly prized though extremely difficult to work, and is used chiefly for wheels, mallets, planes, furniture, &c. It is also excellent for turning purposes, and is one of the woods preferred for making gunpowder charcoal. It is also much prized for fuel when great heat is necessary, as in brick-making. From the liability of the tree to become hollow in the centre it is difficult to get a plank of any width. (Watt)]

35. HYMENÆA L.

Trees, without prickles. Leaves 2-foliolate; leaflets leathery, unequal-sided, with pellucid dots. Flowers white, in short terminal panicles, densely corymbose. Receptacle (calyx-tube) campanulate. Sepals 4, very imbricate. Petals 5, sessile, ovateelliptical, a little unequal, the uppermost often larger. Stamens 10, free, glabrous. Ovary shortly stalked; stalk adherent to the hollow receptacle. Pod somewhat woody, large, not opening. Seeds few.

Species 8, natives of tropical America.

H. Courbaril L. Sp. Pl. 1192 (1753) & ed. 2, 537; Gaertn. Fruct. ii. t. 145; Descourt. Fl. Ant. v. t. 359; Hayne Arzneyk. Gew. xi. t. 10; Macf. Jam. i. 349; Griseb. Fl. Br. W. Ind. 213; Benth. in. Plukenet's specimen is in Herb. Sloane. A specimen named

by Linnæus is in Herb. Linn.

West Indian Locust Tree, Stinking Toe.

Plukenet in Herb. Sloane xcv. 157 & xcix. 184! Sloane, pods! Liguanea, Browne; common in Liguanea and the plains of St. Elizabeth, Macfadyen; St. Andrew, McNab! Purdie; Porus, Lloyd; near Kingston, Campbell! Hope grounds, Harris! Fl. Jam. 6414.—West Indies, tropical continental America.

Tree 30-60 ft. high, with wide-spreading branches, and glabrous twigs and leaves. Leaflets oblong to ovate, shortly acuminate, curved inwards, the inner side only half as broad as the outer, 6-9 cm. l. Receptacle 7-9 mm. l. Calyx 1·5 cm. l. Petals white, thin, with pellucid dots, scarcely longer than the calyx. Stamens 3-3·5 cm. l., white. Pod thick, compressed, chocolate coloured, rough, '5-1 dm. (-2·2) l., 3-4·5(-10) cm. br.,

with 2 or more seeds imbedded in thick mealy pulp.

"The resin is frequently brought from Surinam on the main Continent of America to Jamaica, where 'tis very much valued and prized for its Virtues in curing Aches, &c." (Sloane). "A fine transparent resin exudes between the principal roots. It is the Gum Animi of the shops. It requires highly rectified spirits of wine to dissolve it, and makes the finest varnish known, superior even to the Chinese lacca. It burns readily, emitting a grateful and fragrant smell, and has been employed by way of fumigation in attacks of spasmodic asthma and other embarassments of respiration. In solution, it is given internally in doses of a teaspoonful, as a substitute for Gum Guiacum, for rheumatic complaints, and employed externally as an embrocation. A decoction of the inner bark is said to act as a vermifuge. The wood is considered an excellent timber; is extremely hard, of a close texture, taking a fine polish, and is well adapted for making the cogs of wheels in machinery" (Macfadyen). Browne and Macfadyen are doubtful whether the tree is a true native, but we see no reason for declining to consider it indigenous.

36. CRUDIA Schreb.

Trees. Leaves imparipinnate; leaflets alternate. Racemes simple, terminal or lateral on last year's twigs. Bract and bracteoles lasting as long as the flower in the Jamaican species. Receptacle (calyx-tube) short. Sepals 4, imbricate. Petals none. Stamens 10 (8, 9), free; anthers versatile. Ovules few (about 4). Pod sessile, woody or leathery, flat-compressed, obovate-roundish or oblong, opening after some time at the margins. Seeds large, 1 or 2.

Species 10, mostly natives of tropical America, 1 of tropical

Africa, 1 of East Indian archipelago, and 1 of Ceylon.

the receptacle (calyx-tube). Receptacle short. Sepals 5, roundish, subpetaloid, very imbricate. Petals none. Stamens 10, free; anthers versatile. Ovules 2. Pod obliquely obovate-roundish, flat-compressed, woody, 2-valved. Seed 1, pendulous, large. Species 1, native of Jamaica and Central America.

P. copaifera Griseb. Fl. Br. W. Ind. 215 (1860); Benth. in Trans. Linn. Soc. xxiii. 390, t. 40. (Fig. 37.)

Bachelors Hall, near Bath, Wilson! Mansfield, near Bath; Meylersfield; Harris! Bachelors Hall, common at 600 ft., Harris & Britton! Fl. Jam.

6001, 10,575, 11,814.—Panama.

Tree 35 to 100 ft. high, 3-4 ft. in diam., glabrous. Leaflets elliptical or rree 35 to 100 ft. nigh, 3-4 ft. in diam., glabrous. Leaflets elliptical or ovate-elliptical, slightly curved inwards, sides somewhat unequal, apex sometimes shortly and abruptly acuminate, with pellucid dots, veins prominulous on both sides, 7-16 cm. 1. Bracteoles exceeding 1 mm. 1. Flowers pale yellow, strongly scented. Sepals about 2.5 mm. 1.; margin minutely ciliolate. Stamens 5 mm. 1.; filaments hairy below; apex of connective fleshy, conical, appearing below the reversed anther. Pod 7-10 cm. 1., and about as broad, one side convex, the other flat or concave, marked by longitudinal somewhat prominent veins running from the base marked by longitudinal somewhat prominent veins running from the base and sides and uniting at the apex, not splitting open, the seed germinating in the pod and growing out at the apex.

SUBFAMILY 3. MIMOSEÆ.

Flowers regular, parts of the flower generally in 5's, small, in globular heads or cylindrical spikes. Sepals valvate. Petals equal in number to the sepals, valvate, distinct or united into a lobed corolla, hypogynous. Stamens equal in number to the sepals, or twice as many, or numerous; filaments distinct, or united below into a tube, or adhering at the base to the tube of the corolla; anthers small, versatile. Radicle straight, shortly exserted or enclosed. Leaves bipinnate, but pinnate in Inga.

§ 18. Parts of the flower in 5's. Stamens 10, distinct; anthers with a small gland, which falls soon after the opening of the flower. Pollen granules numerous, distinct.

38. ENTADA Adans.

Climbing shrubs; stem often very long. Leaves with the uppermost pair of pinnæ converted into tendrils in E. qiqas. Calyx campanulate, 5-toothed. Stamens shortly exserted. Pod sometimes very large, flat-compressed, jointed; the joints 1-seeded, separating from each other, and leaving a continuous persistent margin.

Species 10, of which 1 is found widely distributed in the tropics, 3 are confined to tropical America, and 6 are African.

Cocoon, Cacoon, Mafootoo Withe.
"Thickets, beyond Mt. Diablo; Moneague Savanna; hills between Guanaboa and Mountain River Plantations," Sloane Herb. iii. 67*, 68!

Masson! St. George, McNab! Prior! J.P. 979, Hart! Port Antonio, Hitchcock; Castleton, Thompson! also Harris! Fl. Jam. 7251.—Hispaniola, Guadeloupe, St. Vincent, tropical continental America, subtropical S. Africa,

tropical Africa, Australia, Polynesia, and Asia.

Stem climbing along the tops of shrubs or high trees, often 100–150 ft. long, and covering acres of woodland. Pinnw in 2 (or 1) pairs; leaflets in 4 or 5 (2-)pairs, obliquely oblong-elliptical, blunt or emarginate, slightly curved inwards, sides unequal, 2–8 cm. 1.; stipules awl-shaped, adpressed, about ·5 cm. 1. Spikes usually solitary (sometimes 2), longer than the leaves, springing from a point about ·5 cm. above the axil, with tufted glands between the axil and the insertion, occasionally ending in a tendril (Macfadyen); flowers numerous, small, crowded. Bracteoles persistent, 1–1·5 mm. 1. Calyx about 1·5 mm. 1. Petals 5, oblong, greenish-yellow or green, 3–4 mm. 1. Stannens 10, twice as long as the petals, twisted; anthers sometimes bearing a minute stalked gland. Pistil sometimes abortive. Pod very large, 1–2 m. 1, 1 dm. or more br., twisted in various directions, 10–12-seeded. Seeds roundish-compressed, 5 cm. in diam.; cotyledons separated by a large median air-space which reduces the specific gravity of the seed and so enables it to float.

The seeds are found cast up by the sea, not only on the Palisadoes in Jamaica, but also on the shores of north-west Europe; there are specimens in Sloane's fruit collection of seeds cast up in the Hebrides and Orkney Is.

39. PIPTADENIA Benth.

Trees or shrubs, without spines or prickles (in *P. peregrina*). Leaflets small, in numerous pairs; glands on the petiole and between the terminal pinnæ. Flowers in globular heads (in *P. peregrina*); peduncles axillary, solitary or clustered, becoming paniculate at the ends of the branches. Parts of the flowers sometimes in 4's. Calyx campanulate, toothed. Petals united to about the middle. Stamens exserted. Pod broadly flat, 2-valved, continuous within.

Species 38, mostly natives of tropical America, a few in

tropical Africa.

P. peregrina Benth. in Hook. Journ. Bot. iv. 340 (1842) (in part), in Fl. Bras. xv. pt. 2, 282 & in Trans. Linn. Soc. xxx. 373, 647; Urb. Symb. Ant. iv. 269. Mimosa peregrina L. Sp. Pl. 520 (1753). Acacia peregrina Willd. Sp. Pl. iv. 1073 (1806). A. angustiloba DC. Prodr. ii. 470 (1825). A. trichophylloides Macf. Jam. i. 320 (1837). (Fig. 39.)

Bastard Tamarind.

"Fl. May, June, common Port Royal Mts.," Macfadyen.—Hispaniola, Porto Rico, Dominica, St. Vincent, Trinidad, tropical and subtropical

Shrub or tree, 10-40 ft. high. Leaves 1·5-2 dm. l.; pinnæ in 10-13 pairs, 3·5-5 cm. l.; leaflets in 35-40 pairs, linear, unequal-sided, especially at the base, 2-4 mm. l. Peduncles generally 4 in a cluster, 3-4 cm. l. Flowers white; heads with stamens about 1·5 cm. in diam. Calyx 2 mm. l., puberulous on the outside. Corolla 3 mm. l., puberulous on the outside. Stamens more than twice as long as the corolla. Pod 1-2 dm. l., 1·5-2·5

cm. br., leathery, margins slightly enlarged, somewhat constricted between the seeds; surface with leprous markings.

We have not seen any specimen from Jamaica, but follow Bentham in considering Macfadyen's Acacia trichophylloides as a synonym.

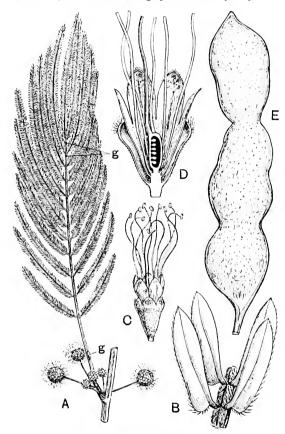

Fig. 39.—Piptadenia peregrina Benth.

[ADENANTHERA L.

Trees. Leaflets alternate, 12-18 in A. pavonina. Flowers minute, crowded in long slender racemes, hermaphrodite or polygamous. Calyx campanulate, shortly toothed. Stamens scarcely exserted. Pod strap-shaped, swollen at the ends, 2-valved, the valves much twisted after they separate.

Species 3 or 4, natives of tropical Asia, Africa and Australia, of which one (A. pavonina) is cultivated or spontaneous throughout the tropics.

A. pavonina L. Sp. Pl. 384 (1753); Jacq. Coll. iv. t. 23; Wight. Ill. t. 80; Griseb. Fl. Br. W. Ind. 217; Bedd. Fl. Sylv. t. 46; Benth. in Trans. Linn. Soc. xxx. 375 & in Fl. Bras. xv. pt. 2, 288; Bak. in Hook. f. Fl. Br. Ind. ii. 287; Watt Econ. Prod. i. 107; Urb. Symb. Ant. iv. 269. Type in Herb. Hermann in Herb. Mus. Brit.

Circassian Seed.

Naturalized; Wullschlaegel; Moneague, Prior! very common in Clarendon, Harris! Fl. Jam. 11,075; Port Antonio, Hitchcock.—India, Ceylon, Ma'ay Islands, Philippines, China; introduced in America (incl.

W. Indies), also perhaps in Africa and Australia.

Tree to 40 ft. high. Pinnæ in 2-5 pairs, 1-2 dm. l.; leaflets elliptical or oblong-elliptical, very obtuse, 2-4 cm. l. Racemes 5-15 cm. l.; simple from the axils of the leaves, panicled at the end of branches. Flowers orange-coloured, 3-4 mm. l., pedicels as long. Pod 15-25 cm. l., 12-16 mm. br., curved. Seeds 10-12, of the same colour all over, usually bright scarlet, varying in Jamaican specimens from 6-10 mm. br.

"The heart-wood is red, hard, close-grained, durable and strong. The timber is used in southern India for house-building and cabinet-making purposes...The seeds are used as weights in India, each being about 4 grains; they are also strung and made into necklaces. Powdered and beaten up with borax, they give a good cement" (Watt).]

[PROSOPIS L.

Trees or shrubs. Leaves with pinnæ in 1 or 2 pairs; leaflets in few to many pairs. Flowers small, in axillary spikes in P. juliflora. Calyx campanulate, shortly toothed. Stamens exserted. Pod linear, not opening, thick, spongy, with the seeds each in a separate cell.

Species 25, natives of tropical and subtropical regions, but

chiefly American.

P. juliflora DC. Prodr. ii. 447 (1825); Macf. Jam. i. 311; Griseb. Fl. Br. W. Ind. 217; Benth. in Fl. Bras. xv. pt. 2, 289 & Trans. Linn. Soc. xxx. 377; Sarg. Silv. iii. 101, t. 136, 137. Occ. 986 (misprint piliflora); Descourt. Fl. Ant. viii. t. 550. Acacia juliflora Willd. Sp. Pl. iv. 1076 (1805). M. salinarum Vahl Eclog. Am. iii. 35 (1807). A. salinarum DC. Prodr. ii. 456 (1825); Macf. Jam. i. 313.

Cashaw.

Houstoun! Browne; Shakspear! Masson! Salt Ponds district, von Rohr; Mactadyen; Oersted! Prior; Hope, Fawcett! Kingston; Constant Spring, Hitchcock; Long Mt. road, 250 ft.; Hope; Harris! Fl. Jam. 5667, 6980, 8525.—West tropical and subtropical N. and S. America. Browne states that it was "introduced from the main continent, and thrives very luxuriantly in many parts of the low lands." There is no specimen in Sloane's Herbarium.

A glabrous shrub or tree, 15-40 ft. high, generally with axillary spines. Leaflets, 20-15 (6-30) pairs, oblong to linear, 5-13 mm. l., 1.5-4 mm. br. (continental specimens often much longer); rhachis with sessile glands. Spikes 5-10 cm. 1., 3 to 4 together, densely crowded with small yellow fragrant flowers. Calyx a little over 1 mm.l. Petals woolly inside near the apex, 3 mm.l. Stamens about 4 mm.l. Pod generally one in each spike, curved or nearly straight, 15-20 (5-) cm. l., 6-16 mm. br., at length

6-8 mm. thick, with sweetish pulp.

"The wood is heavy, hard, and close grained, although not very strong ...It is almost indestructible in contact with the soil, and is valued for fence posts and railway ties... It is sometimes used in furniture, for the fellies of heavy wheels, and for the pavement of city streets; and it affords the best and often the only fuel in the regions where it grows, burning slowly with a bright clear flame. It produces valuable charcoal, but is unsuited to the generation of steam on account of the destructive action upon boilers of the tannin which it contains... An astringent decoction obtained by boiling chips of the heart-wood may be used to check diarrhea or dysentery, or by infusion to purify muddy or stagnant water . . . A gum resembling gum arabic exudes from its stems" (Sargent).]

40. NEPTUNIA Lour.

Herbs. Leaflets small. Stipules obliquely cordate. Flowerheads on axillary peduncles; upper flowers hermaphrodite; lower male or neuter with small calyx and corolla and 10 petaloid long-exserted staminodes. Stamens generally 10, exserted. Pod obliquely oblong, short, broad, flat, 2-valved, more or less divided between the seeds.

Species 8, natives of North and South America, Asia and tropical Australia, of which one, a floating plant, is found widespread throughout the tropics.

1. N. oleracea Lour. Fl. Coch. 654 (1790); Griseb. Fl. Br. W. Ind. 217; Benth. in Fl. Bras. xv. pt. 2, 290, t. 78 & in Trans Linn. Soc. axv. 383. Mimosa lacustris Humb. & Bonpl. Pl. Equin. i. 55, t. 16 (1806). (Fig. 40.)

Ponds, near Hodges Pen, St. Elizabeth, Purdie!-Tropical America,

Asia, and Africa.

IV.

Glabrous herbs, with spongy stem frequently floating by means of hollow swellings, and branching and rooting so as to cover shallow waters or swamps; stem swellings 1-2 cm. thick. Leaves 5-7 cm. l.; rhachis without a gland. Pinnæ in the upper part of the petiole, in 2 or 3 pairs, 4-5 cm. l. Leaflets in 8-20 pairs, linear-oblong, 6-12 mm. l. Stipules broadly and obliquely cordate, acute, 5-7 mm. l. Peduncles axillary, 7-13 cm. l. in flower, longer in fruit. Bracts, 1 or 2 about the middle of the peduncle, ovate, 4-12 mm. 1. Flower-heads white, changing to yellow, ellipsoidal in bud, becoming hemispherical in flower, with numerous sterile flowers radiating from the base. Sterile flowers with small or obsolete calvx, 5 petals, 2-4 mm. l., and 10 narrowly linear-lanceolate

staminodes, 7-14 mm. l. Perfect flowers sessile, calyx 2 mm. l., petals 4 mm. l., stamens twice as long as the petals. Pod 2-2·5 cm. l., '8-1 cm. br., flat, mucronate, bent down at a right angle from the stalk (5-8 mm. l.). Seeds 5-8 (3-9), obovate, brownish-black, about ·5 cm. l.

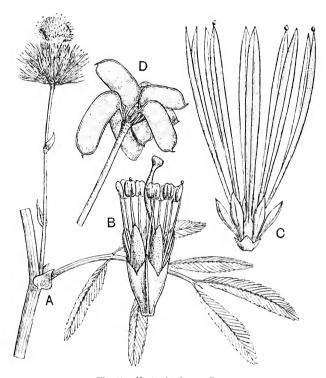

Fig. 40.—Neptunia oleracea Lour.

LEGUMINOSÆ

Desmanthus punctatus Willd. Sp. Pl. iv. 1047 (1806). A specimen named by Linnaus (M. plena), and another from Browne named by Linnaus M. punctata, are in Herb. Linn.

Sixteen Mile Walk, Sloane Herb. vi. 47, 48! Browne! Wullschlaegel; Pond, Old Hope, Westmoreland, Harris! Fl. Jam. 11,826.—Bahamas, West Indies, tropical continental America, also tropical Asia, but probably

introduced (Bentham).

Very like N. oleracca Lour. and perhaps not separable as a distinct species. Both Grisebach and Bentham treat them as distinct, relying on the following characters for N. plena: Pinnæ, 3-5 pairs; rhachis bearing a sessile gland just below the lowest pair of leaflets. Leaflets 12-40 pairs. Pod larger (to 5 cm. l.), more erect. Seeds 5-20. Plant more terrestrial.

§ 19. Parts of the flower in 5's or 4's. Stamens as many as, or twice as many as, the petals; anthers without glands. Pollen granules numerous, distinct.

41. DESMANTHUS Willd.

Perennial herbs or undershrubs. Leaflets very small; a sessile cup-shaped gland just below the lowest pair. Stiuples

bristle-like, persistent. Flowerheads on solitary axillary stalks. Floral parts in 5's. Calyx campanulate, toothed. Petals free or slightly cohering. Stamens 10 (rarely 5), free, exserted. Pod linear, flat-compressed, 2valved.

Species 8 or 9, natives of North and South America and West Indies, one (D. virgatus) widely dispersed throughout tropical and subtropical regions.

D. virgatus Willd. Sp. Pl. iv. 1047 (1806); Griseb. Fl. Br. W. Ind. 218; Benth. in Fl. Bras. xv. pt. 2, 293, t. 79 & in Trans. Linn. Soc. xxv. 385; Urb. Symb. Ant. iv. 268. D. depressus Humb. & Bonpl. ex Willd. Sp. Pl. iv. 1046 (1806); Kunth Mimos. 115, t. 35 (1822); Benth. loc. cit. D. strictus Bertol. in Giorn. Arcad. xxi. 190

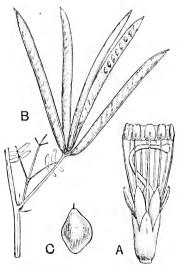

Fig. 41.—Desmanthus virgatus Willd.

(1824); DC. Prodr. ii. 445; Macf. Jam. i. 310. D. pratorum Macf. Jam. i. 311 (1837). Mimosa americana pigra &c. Pluk.

Phyt. t. 307, f. 3. Herba mimosa non spinosa &c. Sloane Cat. 153 & Hist. ii. 58. Mimosa virgata L. Sp. Pl. 519 (1753): Jacq. Hort. Vindob. 34, t. 80. M. pernambucana L. loc. cit. Acuan virgatum Medik. Theod. 62 (1786). (Fig. 41.) Type in Herb. Linn.

Ground Tamarind.

Near St. Jago de la Vega and in other places, Sloane Herb. vi. 50! Old Harbour, Broughton! Bancroft! Liguanea plain; Lucky Valley, Port Royal Mts.; Oxford, St. Thomas in the East; Macfadyen! March! Green Valley, J.P. 1358, Morris! King's House, J.P. 1348, Hart! Kingston; Port Morant; Hitchcock; Mona, Campbell! Ewarton, 1000 ft.; Hope grounds; Harris! Fl. Jam. 5871, 6670, 11,931.—Tropical and subtropical regions.

Shrub erect, 2-4(-6) ft. high, or branches diffuse or prostrate; branches angular or somewhat 4-cornered above and terete below. Pinnæ 2-5(-7) pairs, 1.5-4.5 cm. l.; leaflets 10-25 pairs, linear or oblong-linear, 4-8 mm. l.; gland cup-like, ovate or circular. Flower-heads with 6-8 whitish flowers. Calyx about 2.5 mm. 1. Petals about 4 mm. 1. Stamens at length about twice as long as the corolla; anthers sometimes aborted in the lower flowers. $Pod\ 6.5-3(-8)\ cm.\ 1.,\ 3-4\ mm.\ br.,\ linear.$ Seeds 10–20 or more.

Bentham retains D. depressus Humb. & Bonpl. as a species distinct from D. virgatus Willd.; the distinguishing features are the weak, less angular and more procumbent stem; pinnæ generally not more than 1.5 cm. l., in 1-5 pairs; leaflets smaller and narrower, in 10-20 pairs; and much smaller gland. It seems to us merely a weak form of the species, a view which is borne out by Macfadyen's detailed descriptions of his two species.

42. MIMOSA L.

Herbs, shrubs or trees. Leaves generally sensitive, usually without glands on the stalks. Flower-heads stalked. Flowers hermaphrodite or polygamous; parts of the flowers in 4's. Calyx generally minute, inconspicuous. Petals more or less united. Stamens as many, or twice as many, as the petals, generally twice as long, rosy or white, free. Pod compressed, 2-valved; valves separating from the entire thickened border, and breaking up into joints with 1 seed in each joint.

Species about 300, mostly natives of tropical America, a few

of Africa and Asia, none in Australia.

Herbs, sometimes woody below in M. pudica. Without prickles. Pinnæ, in 1 pair...... 1. M. viva.

With prickles. Pinnæ subdigitate, in 2 pairs..... 2. M. pudica.

Shrubs or trees.

Pinnæ in 4-8 pairs.

[Flower-heads white. Stipels minute prickles M. bimucronata. Flower-heads rosy. Stipels bristle-like 3. M. invisa. Pinnæ in 8-15 pairs. Flower-heads pale rosy-lilac M. pigra.

1. M. viva L. Sp. Pl. 517 (1753); a very small prostrate glabrous herb, without prickles, rooting at the nodes.—Macf. Jam. i. 304; Griseb. Fl. Br. W. Ind. 218; Benth. in Trans. Linn. Soc. xxx. 392. M. herbacea non spinosa minima &c. Sloane Cat. 153 & Hist. ii. 58, t. 182, f. 7. M. minima &c. Browne Hist. Jam. 254. A specimen from Browne, named by Linnæus, is in Herb. Linn. Specimen from Sloane, the type, is in Herb. Mus. Brit.

Magotty and Moneague savannas, Sloane Herb. vi. 49! Browne! Wright! St. Ann; between Port Morant and Morant Bay; Broughton! Swartz! East Prospect, St. Thomas in the East, Macjadyen; Moneague,

Prior! Moneague, Fawcett!—Cuba.

Leaf extremely sensitive to touch. Pinnæ, 1 pair, 1-2 cm. l.; leaflets in 4 pairs, oblong, blunt, 3-5 mm. l.; petiole 1-2 cm. l. Flower-heads ovate or globular, few-flowered; peduncles solitary, axillary, about as long as the petiole. Stamens as many as the petals, and twice as long. Pod

ovoid, bristly in the centre of the valves, 1-jointed, 5-6 mm. l.

"This small plant grows in patches, densely covering the ground for several feet in extent. It is perhaps the most sensitive of its kind, its leaves affected even by the breeze, and instantly collapsing on being touched, so that you may write your name on a bed of it, by means of a stick drawn lightly over the surface, and the letters will remain legible for several minutes" (Macfadyen).

2. M. pudica L. Sp. Pl. 518 (1753) (excl. syn. Breyn., Comm.); a prickly herb, stems woody at the base, long, prostrate, some-

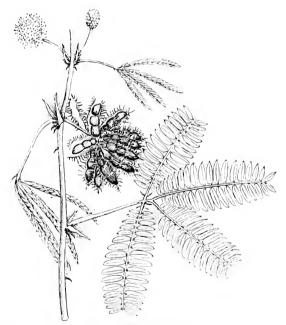

Fig. 42.—Mimosa pudica L.
Leaves expanded and closed. Flowers in bud and open.
Pods showing how the borders break away.

times more or less erect and subshrubby; leaves subdigitately pinnate, the pinnæ being close together in 2 pairs (or sometimes some leaves have only 1 pair); leaflets in 15-27 pairs.—Bot. Reg. t. 941; Macf. loc. cit.; Griseb. op. cit. 219; Benth. tom. cit. 397, & in Fl. Bras. xv. pt. 2, 316. M. aculeata foliis quadripinnatis Plum. Pl. Amer. (Burm.) t. 202. (Fig. 42.) A specimen from Browne, named by Linnaus, is in Herb. Linn.

Shame Weed.

Browne! Masson! Prior; March! Cavalier's Pen, J.P. 1378, Syme! Kingston, Clute! Bog Walk; Port Morant; Lucea, Hitchcock; Porus, Lloyd; Ginger Piece, Blue Mts., J.P. 1428, Campbell! Cedar Valley, Watt! Pittsfield, 500 ft.; Scott's Hall, 700 ft.; Thompson! Fl. Jam. 6755, 7916; Swamp, Golden Grove, Miss Walter!—A common weed in tropical America (incl. W. Indies), naturalized in many parts of tropical Africa and Asia.

Stems 3-6 (9) dm. l., glabrous or hispid, with prickles below the stipules, and also scattered along the internodes. Leaf sensitive to the touch; pinnæ 2-9 cm. 1.; leaflets linear, acute, very oblique at base, 5-1 cm. 1., with villose adpressed hairs on margin and generally on under surface; petiole (and rhachis) glabrous or hispid, 1·5-6 cm. 1. Stipules lanceolate or linear-lanceolate with villose margins, 5-10 mm. 1. Flower-heads rosy, ellipsoidal or globular. Peduncles solitary or 2-3 together, about as long as, or shorter than, the petiole. Bract below each flower, 1-2 mm. l., linear with glabrous margin and shorter than the flower-bud, or linearspathulate with long villose hairs on the margin and longer than the flower-bud. Calyx about 2 mm. 1. Corolla about 2 mm. 1. Stamens as many as the petals and twice or thrice as long. Pod 1-1.5 cm. l., 3-4 mm. br., margins with bristles, persistent; valves glabrous, smooth, 3-4-jointed.

There are two forms :-

a. form hispidior Benth., hispid; stipules long, 6-10 mm. l.; bracts

with villose margins, longer than the flower-bud, 2 mm. 1.

b. form glabrior Benth., more or less glabrous; stipules shorter, 4-5 mm.l.; bracts with glabrous margins, shorter than the flower-bud, 1-1.5 mm. l. Further investigation in the field is required to determine whether these are distinct forms, or whether they pass into one another.

This species is a troublesome weed in pastures, as the prickles wound the mouths of stock feeding where it grows, and are even dangerous to young calves. The weed has to be cut out by hand labour, or sheep are

used to feed it down. The leaves are very sensitive.

[M. bimueronata Kuntze Rev. Gen. Pl. i. 198 (1891); shrub or tree to 25 ft. high, with (or occasionally without) prickles; pinne in 4-8 pairs; stipels in the form of 2 minute prickles; flower-heads white, in a panicle.—M. sepiaria Benth. in Hook. Journ. Bot. iv. 395 (1842), in Fl. Bras. xv. pt. 2, 364, t. 91 & in Trans. Linn. Soc. xxx. 423. M. thyrsoidea Griseb. loc. cit. (1860). Acacia bimucronata DC. Prodr. ii. 469 (1825).

Brazil Macca.

Near Christiana, Harris! Spaldings, Miss Wood! Hanbury, near Kendal, Harris & Britton! Fl. Jam. 8242, 10,625.—Brazil, Paraguay; naturalized in Jamaica, Singapore, and southern China.

Pinnæ 2·5-5 cm. 1.; leaflets in numerous pairs, linear-oblong, midrib

submedian, 5.5-10 mm. l.; stipules bristle-like, 4-5 mm. l., soon falling.

Flower-heads globular, 5-6 mm. in diam. without the stamens, many-flowered, forming a terminal paniele often 3 dm. l. Calyx about ·7 mm. l. Corolla about 2·5 mm. l. Stamens twice as many as the petals and thrice as long. Pod flat, glabrous, without prickles, 4-5 cm. l., 7-8 mm. br.; valves 5-8-jointed. Used for making hedges.]

3. M. invisa Mart. in Flora xx. Beibl. 121 (1837); shrub or undershrub, with pubescent angled stems several feet long, trailing over bushes and climbing by means of numerous recurved prickles on stems and petioles; pinnæ in 5 or 6 (4-8) pairs, with a bristle between the pinnæ; stipels bristle-like; flower-heads rosy, 1 or 2 in axils; peduncle much shorter than the petiole.—Benth. in Fl. Bras. xx. pt. 2, 379, t. 97 & Trans. Linn. Soc. xxx. 436; Urb. Symb. Ant. vi. 103. M. diplotricha Wright in Saux. Pl. Cub. 34 (1868). Schrankia brachycarpa Benth. in Hook. Journ. Bot. ii. 130 (1840); Griseb. Fl. Br. W. Ind. 220. An authentic specimen from Martius is in Herb. Mus. Brit.

St. Cruz, 450 ft., Harris! Fl. 9863.—Cuba, Trinidad, tropical continental America.

Leaves 4-11 cm.l.; pinnæ 2-4 cm.l.; bristle and stipels about 2 mm.l.; leaflets in numerous pairs, oblong. 4-5 mm.l.; petiole 5-6 cm.l. Flowerheads globular; peduncle barely 1 cm.l. Calyx minute, about '3 mm.l. Corolla about 2 mm.l. Stamens twice as many as the petals, 2-2½ times as long. Pod 1·5-2·5 cm.l., 5-6 mm. br., margins spiny; valves pubescent, bristly, 4 or 5-jointed.

[M. pigra L. Cent. Pl. i. 13 (1755) & Sp. Pl. ed. 2, 1507; shrub 4-8 ft. high, with long straggling hispid prickly branches: pinne in 8-15 pairs with a spine between the pinne, and generally with 2 prickles in the interval between the insertion of the pairs; flower-heads pale rosy-lilac, shortly stalked, 1 or 2 in the axils of the young leaves.—Sw. Obs. Bot. 392. M. asperata L. Syst. ed. 10, 1312 (1759) & Sp. Pl. ed. 2, 1507; Macf. Jam. i. 305; DC. Lég. t. 63; Griseb. loc. cit.; Oliv. Fl. Trop. Afr. ii. 335; Benth. in Fl. Bras. xv. pt. 2, 381 & Trans. Linn. Soc. xxx. 437. M. pellita Humb. & Bonpl. ex Willd. Sp. Pl. iv. 1037; Kunth Mimos. 27, t. 9. Æschynomene spinosa quarta &c Breyn. Cent. Prim. 43, t. 19. Æ. spinosa quinta Breyn. Cent. Prim. 44. t. 20; Commel. Amst. i. 59, t. 30. Mimosa caule fruticoso &c. Miller Ic. t. 182. M. frutescens spinosa &c. Browne Hist. Jam. 253.

Wright! Westmoreland, Purdie! Lucea, Hitchcock; in wet places, Montpelier, St. James; Meylersfield; Harris! Fl. Jam. 11,807, 11,815.—Tropical America, and widely spread over tropical and subtropical Africa and the Mascarene islands.

Leaves to 1.5 dm. 1.; pinnæ 2-4.5 cm. 1.; spine 2-10 mm. 1.; leaflets in many pairs (generally more than 30), linear, pubescent beneath, sensitive to touch, 5-8 mm. 1. (the petiole is not sensitive). Flower-heads globular, 9 or 10 mm. in diam. without the stamens; stalk as long as the head, or 2-3 times longer. Calyx about 2 mm. 1., with a ciliate-fringed margin. Corolla 4-cleft, hispidulous at and near the upper margin, 4 mm. 1. Stamens twice as many as petals, 1½-2 times as long. Pods

generally several in each head, 3-6 cm. l., 10-12 mm. br., flat, valves very

hispid, 10-20(-30) jointed.

Browne (loc. cit.) states that this species was introduced from Panama, "and is now cultivated in some of the gardens of the curious, but is yet rare."]

43. LEUCÆNA Benth.

Trees. Gland in the middle of the petiole, or just below the pinnæ, or sometimes wanting, sessile, somewhat elliptical. Flower-heads globose, white, stalked. Floral parts in 5's. Calyx tubular-campanulate, toothed. Petals free. Stamens 10, free, exserted. Pod shortly stalked, broadly linear, flat-compressed, rigidly membranous, 2-valved; seeds compressed, transverse to the valves; embryo enclosed on its two sides by a thin layer of horny endosperm.

Species 10, natives of tropical America, one occurring throughout the tropics, spontaneous or cultivated, and one found in the

islands of the Pacific.

1. L. glauca Benth. in Hook. Journ. Bot. iv. 416 (1842); pinnæ in 4-8 pairs, 6-8 cm. l.; leaflets in 10-12 pairs, oblongfalcate, oblique, unequal-sided, glaucous or paler beneath, 7-12 mm. 1., 2-3.5 mm. br.—Benth. in Fl. Bras. xv. pt. 2, 391 & in Trans. Linn. Soc. xxx. 443; Griseb. Fl. Br. W. Ind. 220; Sarq. Silv. iii. 111, t. 139; Cook & Coll. Contrib. U.S. Nat. Herb. viii. 175; Urb. Sumb. Ant. iv. 266. Mimosa glauca L. Sp. Pl. 520 (1753).

Prior; March; Port Morant; Lucea; Hitchcock; Hart! Hope; Papine; Harris! Fl. Jam. 6713, 8367.—Warmer regions of the New and the Old

World, probably of American origin.

Shrub or slender tree 15-20 ft. high. Flower-heads (excl. stamens) about 1.4 cm. in diam., with numerous flowers; peduncles axillary, 1, or 2-3 together, 3-5 cm. 1., racemose at the end of the branches. Calyx about 2·3 mm. l. Petals 4·4 mm. l. Stamens twice as long as petals. Pods generally many in the same head, 10-15 cm. l., 1-1·7 cm. br. Seeds numerous, oblong, 6 mm. l., with a long thread-like stalk.

This species grows in very dry places, and is sometimes browsed by horses and mules, in which case the hair is affected, the mane and tail dropping, and even the hoofs falling off, if eating the leaves is persisted in.

2. L. brachycarpa Urb. Symb. Ant. ii. 265 (1900); pinnæ in 10-25 pairs, up to 3.5 cm. l., leaflets in 25-55 pairs, linearoblong, acute, 2-4 mm. l., · 6 mm. br.

Hope grounds, Campbell! Westphalia, Watt! Berwick, Fawcett! below Content Gap, St. Andrew, 3200 ft.,; near Guava Ridge, 3500 ft.; Harris! Fl. Jam. 12,342, 12,393.—Martinique, Mexico.

Tree. Flowers; pedureles axillary, generally 2 together, 1-2 cm. l. Calyx 1 5-2 mm. l. Petals about twice as long. Pods 1-5 in each head, 6-11 cm. l., 1-2 cm. br.

§ 20. Parts of the flower in 5's or 4's. Flowers in globular heads, or in spikes (in A. suma). Stamens numerous, distinct or only slightly united at the base. Pollen granules in 2-6 masses in each cell.

44. ACACIA Willd.

Trees or shrubs, with or without prickles or spines. Leaflets generally small (less than 1 cm. l., but to 1·4 cm. in A. rugata), in numerous pairs, generally with a gland on the petiole. Stipules spiny or inconspicuous. Flowers in globular heads or cylindrical spikes. Peduncles axillary, solitary or clustered, or paniculate at the apex of branches. Flowers small, hermaphrodite or polygamous; floral parts in 5's or 4's. Calyx campanulate, toothed, lobed, or divided into distinct sepals. Stamens numerous, free or slightly united at the base, exserted; anthers small; pollen aggregated in 2–6 masses in each cell. Pod compressed, rarely cylindrical, 2-valved or not opening.

Species 450, widely dispersed through the warmer regions of

the world, especially numerous in Australia and Africa.

§ 1. Stipules spiny, otherwise without spines or prickles. Flowers in globular heads. Involucel close under flower-heads. Leaflets in 20-30 pairs, 2-3 mm. l...... 1. A. lutea. Leaflets in 10-20 pairs, 4-5 mm. l. Pod velvety, obscurely veined, 8-14 cm. l., 7-8 mm. br...... 2. A. tortuosa. Pod glabrous, with longitudinal lines, 4-7 cm. l., A. farnesiana. 8–15 mm. br..... Involucel about middle of peduncle..... A. nilotica. § 2. Stipules not spiny; prickles in pairs below the stipules, or scattered. Prickles in pairs below the stipules. Flowers in A. suma. [Pod glabrous, constricted between the seeds..... .1. rugata. § 3. Without spines or prickles. Flowers in short spikes or oblong heads 4. A. villosa.

- § 1. Shrubs or trees, stipules some or all spiny, otherwise without prickles or spines. Flower-heads globular; peduncles axillary, solitary or in a small cluster, or subracemose at the ends of the branches. Pod thick, swollen or rarely flat, not or scarcely splitting open, with a spongy pulp separating the seeds.
- A. Involucel of bracts close under the flower-head.
- A. lutea Hitchcock in Rep. Miss. Bot. Gard. (1893) 83;
 pinnæ in 40-10 (60-8) pairs; leaflets in 20-30 (15-40) pairs,

2-3 (1·5-4) mm l.; spines when small slender, the larger 2·5-9 cm. l., a little dilated, terete or rarely angled or concave above; pod tomentose, puberulous, or glabrescent, 7-8 (5-10) cm. l., 9-1.2 cm. br., longitudinally net-veined (at length obscurely).— A. macracantha Humb. & Bonpl. in Willd. Sp. Pl. iv. 1080 (1806); Kunth Mimos. t. 28; Griseb. Fl. Br. W. Ind. 221; Benth. in Trans. Linn. Soc. xxx. 500. A. macracanthoides & A. subinermis Bert. e. DC. Prodr. ii. 463 (1825); Macf. Jam. i. 317. A. microcephala Macf. Jam. i. 316 (1837). Mimosa lutea Miller Gard. Diet. ed. 8 (1768). The type, Miller's specimen from Houstonn, is in Herb. Mus. Brit.

Wild Tamarind, Park Nut.

St. Jago de la Vega and thence to Passage fort, Sloane Herb. vi. 42! Pasmore in Herb. Sloane clvii. 268! Houstown! Broughton! Bancroft! Windward Road; Salt Ponds district; Macfadyen! Oersted! Wilson; Prior; March! Constant Spring, Hitchcock; King's House grounds, J.P. 1322, and Hope grounds, Fawcett! near Halberstadt, 2000 ft.; Cane River valley, 1200 ft.; Albion Mt., St. Thomas, 150-200 ft.; Harris! Fl. Jam. 6730, 7405, 10,106, 11,857.—Hispaniola, Guadeloupe, tropical continental America, and subtropical S. America.

Tree or shrub, 15-40 ft. high; twigs and leaf-stalks puberulous or glabrous. Pinnæ variable in length, 5-20 cm. l.; leaflets oblong-linear. Glands sessile, occurring irregularly at the base of the petiole, and between the pinnæ, sometimes wanting. Flowers yellow, fragrant. Calyx 1·5-1·7 mm. l. Corolla 2·2-2·5 mm. l. Pod generally straight, rarely curved, subterete or somewhat compressed, continuous or more or less constricted

between the seeds.

This species, and the two following, can be grown as hedges, if properly pruned. The trunk sometimes attains a diameter of 13 to 2 feet; the wood is used for making charcoal, and also as fire-wood.

2. A. tortuosa Willd. Sp. Pl. iv. 1083 (1805); pinnæ in 2-8 pairs; leaflets in 10-20 pairs, 4-5(-7) mm. l.; spines thick, the larger terete, 2-4 cm. l.; pod puberulous or glabrate, continuous or slightly constricted between the seeds, obscurely longitudinally veined, 8-14 cm. l., 7-8 mm. br.—Macf. Jam. i. 315; Griseb. op. cit. 222; Benth. tom. cit. 501. Mimosa tortuosa &c. Browne Hist. Jam. 251. M. tortuosa L. Syst. ed. 10, 1312 (1759) & Amæn. v. 384, 411; Sw. Obs. Bot. 391; Wright Mem. 225. M. salinarum von Rohr in Herb. Mus. Brit. (non Vahl). The type, Browne's specimen, is in Herb. Linn.

Wild Poponax, Acacia Bush.

Houstoun! Browne! Broughton! Salines opposite Port Royal, von Rohr! Bancroft; Gosse! Wilson; Prior; Hope, J.P. 997, Morris! Port Royal, Hitchcock; Latimer Pen, Campbell! near Kingston, G. Douet! Delta of Hope River, Harris! Fl. Jam. 5873, 9386.—Texas, St. Thomas, St. Cruz, Montserrat, St. Vincent, Central America, Galapagos Is., Colombia, Venezuela.

Shrub or low tree, 10-15 ft.; branches spreading; twigs and leaf-stalks pubescent or glabrescent. Pinnæ 1.5-3 cm. l.; leaflets oblong-linear, blunt; veins slightly prominent. Gland oblong, sessile below lowest pinnæ, and a circular one usually between the 1-3 terminal. Calyx 1·21.5 mm. l. Corolla about 2 mm. l. Stamens about twice as long as the corolla. Pod subterete, straight or curved, constricted or not, between the seeds.

Valid describes, under the name Mimosa salinarum, a specimen collected by von Rohr in the Salt Ponds district of Jamaica, which, from the

description, is evidently Prosopis juliflora DC.

"The pods are richly impregnated with a sticky astringent gum, which may be easily extracted; and would prove an excellent medicine, where rough astringents are requisite" (Browne).

[A. farnesiana Willd. Sp. Pl. iv. 1083 (1806); pinnæ in 4–5 (2–8) pairs; leaflets in 10–20(-25) pairs, 4–5 mm. l.; spines slender, terete, the smaller 4–8 mm. l., the larger to $1\cdot5$ cm. l.: pod glabrous, cylindrical or spindle-shaped, thick, swollen, marked

with longitudinal lines, 4-7 cm. l.. 8-15 mm. br. and thick.—Griseb. Fl. Br. W. Ind. 222; Benth. in Fl. Bras. xv. pt. 2, 394 & in Trans. Linn. Soc. xxx. 502; Bedd. Fl. Sylv. i. t. 52; Bak. in Hook. f. Fl. Br. Ind. ii. 292; Watt Econ. Prod. i. 48; Sarg. Silv. iii. 119, t. 141; Urb. Symb. Ant. iv. 265; Guppy Plants &c. in W. Indies, 166. A. americana &c. Sloane Cat. 152 & Hist. ii. 56 (in part). Mimosa farnesiana L. Sp. Pl. 521 (1753); Descourt. Fl. Ant. i. t. 1. Vachellia farnesiana Wight & Arn. Prodr. 272; Wight Ie. t. 300. (Fig. 43.)

Cassie Flower.

Sloane Herb. vi. 44! Catesby! Wright! Parnell! Wilson; March; Ball! Lucea, Hitchcock.—Tropical and subtropical regions, probably indigenous in western America, in Australia, and in south tropical Africa.

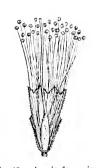

Fig. 43.—Acacia farnesiana Willd.

Flower with calyx and corolla partly removed × 7.

Shrub or low tree; twigs and leaf-stalks puberulous or glabrescent. Pinnæ 2-4 cm. l.; leaflets oblong-linear, blunt; veins slightly prominent.

Calyx 1-1.5 mm. l. Corolla 2-3 mm. l.

The distilled flowers yield a delicious perfume. A tree gives 2 lbs. of flowers, valued at 3d. to 4d. per lb.; an acre in south Europe brings in £30 to £40. The gum is looked upon as good as, or better than, gum arabic (Watt). See also "Perfumery and Essential Oil Record," March, 1916. The wood is hard, heavy, and close-grained; used in India for agricultural implements.]

B. Involucel of bracts persistent about the middle of the peduncle.

[A. nilotica Delile Fl. Ægypt. Illustr. 79 (1812); pinnæ in 4-8 (1-3) pairs; leaflets in 10-30 pairs, 4-6 mm. l.; spines, the smaller straight (rarely recurved), the larger $2 \cdot 5-5(-7)$ cm. l.; pod glabrous or grey-downy, generally much constricted between the seeds, 1-2 dm. l., 1-1 · 5 cm. br.—Nees Pl. Medic. t. 332. A. altera

vera &c. Pluk. Phyt. t. 251, f. 1 & Alm. 3. A. arabica Willd. Sp. Pl. iv. 1085 (1806): Hayne Arzneyk. x. t. 32; Nees Pl. Medic. t. 333; Wils. in Reports Geolog. Jam. 277; Griseb. loc. cit.; Benth. in Trans. Linn. Soc. xxx. 506. A. vera Willd. loc. cit. Mimosa nilotica L. Sp. Pl. 521 (1753). M. arabica Lam. Eneyc. i. 19 (1783); Roxb. Corom. Pl. t. 149. Type in Herb. Linn.

Naturalized: Masson! Wilson: Lucea, Hitchcock,—Tropical Africa,

extending to India.

A shrub or tree. Pinne 1·2-3 cm. l.; leaflets linear, blunt, petiole and rhachis puberulous, with several glands. Calyx 1·2-1·5 mm. l. Corolla twice as long as calyx. Pod scarcely splitting open, straight, flat or slightly convex over the seeds.

§ 2. Shrubs or trees; stipules not spiny; prickles small, in pairs below the stipules, or scattered. Flowers in spikes or globular heads; peduncles axillary, or paniculate at the end of branches.

[A. suma Kurz ex Brandis For. Fl. 187 (1874); tree; prickles small, in pairs below the stipules; flowers in spikes; pod glabrous, net-veined.—Benth. in Trans. Linn. Soc. xxx. 519. A. catechu Benth. in Hook. Lond. Journ. i. 510 (1842); Macf. Jam. i. 314; Griseb. Fl. Br. W. Ind. 220, and most authors (non Willd.).

Naturalized; Sloane Herb. vi. 49*! Lane in Herb. Sloane clxii. 267! Wilson; March; Constant Spring, 600 ft.; Chancery Hall, 400 ft.; Campbell! Constant Spring; foot of Red Hills, St. Andrew; Harris! Fl. Jam. 6140, 6479, 8790, 11,834.—Native of tropical Asia and Africa.

Tree 15 to 20 ft. high; bark white or grey; twigs, petioles and inflorescence velvety. Pinnæ in 10-40 pairs, 2-6 cm. l.; leaflets in 30-50 pairs, linear, somewhat acute, 3-7 mm. l. Large elliptical gland on petiole, and smaller ones at the base of some of the pairs of pinne. Spikes 7-10 cm. 1. Flowers white, changing to pale yellow. Calyx 2 mm. 1., densely pubescent. Corolla 3(-4) mm. 1. Pod 7-12 cm. 1., 1·3-1·8 cm. br.

This species has been generally known as A. catechu Willd. by authors including Bentham (1842), but the latter botanist has, in his monograph on the Mimoseæ, correctly assigned the name A. catechu to the species

with fewer leaflets (20-30 pairs), the corolla 2-3 times as long as the calyx, and the bark brown. Both species yield cutch.

Cutch or Catechu is prepared by boiling down a decoction of chips of the heart-wood, and is especially valuable as an astringent in chronic diarrhea and dysentery. The wood seasons well, takes a fine polish, and is extremely durable. It is not attacked by white ants or toredo. It is used in India for oil and sugar-cane crushers, agricultural implements, and wheelwrights' work. A cubic foot weighs about 70 lbs. (Watt).

3. A. riparia H. B. & K. Nov. Gen. & Sp. vi. 276 (1824); shrub or tree, with branches climbing into higher trees; prickles scattered; flowers in globular heads; pod velvety, glaucous.— Benth. in Trans. Linn. Soc. xxx. 528 & in Fl. Bras. xv. pt. 2, 403; Urb. Symb. Ant. iv. 266. A. sarmentosa Griseb. Pl. Carib. 64 (1857) & Fl. Br. W. Ind. 221 (non Desr.); Wils. in Reports Geolog. Jam. 277.

Wullschlaegel.-Hispaniola, Porto Rico, St. Thomas, St. Cruz, St. Martin, St. Bartholomew, Antigua, Guadeloupe, Martinique, St. Vincent, Grenada,

Trinidad, Mexico, tropical S. America.

Shrub 6 to 25 ft., or tree to 50 ft. Pinnæ in 6-12 pairs, 3-7 cm. l.: leaflets in 15-40 pairs, oblong-linear, 5-9 mm. l. Flower-heads in widespreading panieles. Flowers white. Calyx minute, just over 1 mm. 1. Corolla 2·2-2·5 mm. 1. Pod 8-15 cm. 1., 1·5-2·5 cm. br.

[A. rugata Buch.-Ham. MS. in Wall. Cat. n. 5251 (nomen); trailing shrub, climbing to a height of 20 to 30 ft.; prickles numerous, scattered; flowers in globular heads; pod thick, fleshy, generally constricted between the seeds and breaking at the joints, the valves only splitting open after some time.— A. concinna DC. Prodr. ii. 464 (1825); Benth. in Trans. Linn. Soc. xxx. 531. Mimosa rugata Lam. Encyc. i. 20 (1783). M. concinna Willd. Sp. Pl. iv. 1039 (1805).

Naturalized; Gordon Town, 900 ft., J.P. 1133, Hart! also Harris! Fl. Jam. 8253.—Native of India and the Malay Archipelago.

Pinnæ in 4-8 pairs, 5-8 cm. l.; leaflets, 12-30 pairs, oblong or linear, unequal-sided, very oblique at the base, obtuse, 7-14 mm. l. Peduncles clustered 2-5 together, forming, on the fall of the leaves, a subpaniculate raceme. Calyx 3 mm. l. Corolla 4 mm. l. Pod to 13 cm. l., 1.5-2 cm. br.]

- § 3. Shrubs, without spines or prickles, erect, usually hairy. Flowers in short spikes or oblong heads, 2 or 3 together in the upper axils, becoming paniculate at the ends of branches. Flowers stalked. Pod flat, valves thin, with rib-like margins.
- 4. A. villosa Willd. Sp. Pl. 1067 (1806); Macf. Jam. i. 319; Griseb. Fl. Br. W. Ind. 221; Benth. in Trans. Linn. Soc. xxx. 532. A. non spinosa latiore folio villosa &c. Houstoun MSS. 23. A. lophanthoides DC. Prodr. ii. 457 (1825); Macf. Jam. i. 314. Mimosa villosa Sw. Fl. Ind. Occ. 982 (1800). The specimen named M. arborea in Herb. Linn. belongs to this species. Type (Houstoun's specimen) in Herb. Mus. Brit.

Houstoun! Wright! Browne! Liguanea hills, Broughton! common, low hills on the south side, Macfadyen! Negro River, Purdie! Morant Bay, Oersted! Wilson; Prior! March! King's House grounds, J.P. 1318, 1350, Fawcett! Billy Dunn Pen, Liguanea, 500 ft., Campbell! Hope grounds, 700 ft., Harris!—Central America.

Shrubby tree, 6-12 ft. high, villose or rarely glabrous. Pinnæ in 5 or 6

(4-10) pairs, 3-6 cm. 1.; leaflets in 10-16(-30) pairs, elliptical-oblong, unequal-sided, apex obtuse or somewhat acute, base rounded, 4-8 mm. l.; petiole without a gland; stipules lanceolate, deciduous. Calyx minute, ·7 mm. l. Corolla 2·2-2·5 mm. l. Pod 3·5-4·5 cm. l., 8-10 mm. br.

A. latisiliqua Willd. Sp. Pl. iv. 1067 (1806) is stated by Macfadyen (Jam. i. 318) to be "commonly cultivated in towns." Urban (Symb. Ant. ii. 265) suggests that it is identical with Lysiloma bahamensis Benth., a species found in Florida Keys, Bahamas, Cuba, and Yucatan.

§ 21. Parts of the flowers in 5's. Stamens usually numerous, sometimes few, united at the base or into a tube. Anthers small. Pollen granules in 2-6 masses in each cell.

45. CALLIANDRA Benth.

Shrubs or small trees, without spines or prickles (except in C. hæmatomma). Petiolar glands wanting, but glandular depressions present at base of pinnæ in C. comosa. Flower-heads globose, on peduncles, 1-3 together in axils, or in corymbose racemes; flowers polygamous; floral parts in 5's. Calvx campanulate, toothed. Stamens numerous-10, united below, long exserted; pollen aggregated into 2 or 4 masses in each cell. Pod flat-compressed, usually with thickened margins, 2-valved, continuous within; valves elastically revolute from the apex to

Species 100, natives of tropical and subtropical America, and one of India.

Flower-heads axillary. Pinnæ in 2-4 pairs...... 1. C. portoricensis. Flower-heads in a raceme; racemes terminal,

1. C. portoricensis Benth. in Hook. Lond. Journ. iii. 99 (1844): without spines or prickles; pinnæ in 2-4(-5) pairs; leaflets in 20-25 (10-) pairs; peduncles of flower-heads axillary, generally 3 together.—Griseb. Fl. Br. W. Ind. 224; Benth. in Fl. Bras. xv. pt. 2, 411 & Trans. Linn. Soc. xxx. 543; Urb. Symb. Ant. iv. 265. Mimosa arborea non spinosa foliis &c. Sloane Cat. 152 & Hist. ii. 57. M. portoricensis Jacq. Vieque, St. Jan, Grenada, tropical continental America, western tropical Africa.

Shrub or tree, 9-20 ft. high. Pinnæ 3-10 cm. l., leaflets linear-oblong or linear, apex obtuse, base truncate, sometimes almost auriculate, 6-15 mm.l.; gland wanting; stipules lanceolate, deciduous. Peduncles 3-6 cm.l. Flowers sessile, white, fragrant, about 15 in the head. Calyx 2 mm. 1.

teeth about $\frac{1}{3}$ of its length. Corolla 5 mm. l. Stamens numerous, 2-2.5 cm. l., shortly united at the base. Pod glabrous or slightly puberulous, 5-10 cm. l., 5-8 mm. br., 6-13-seeded, margins thickened; valves thin, chartaceous, when ripe rolling back spirally from the apex.

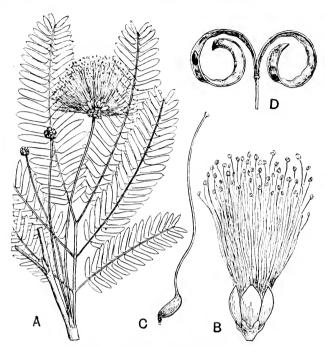

Fig. 44.—Calliandra portoricensis Benth. A, Leaf and inflorescence \times 2_3 . C, Pistil \times 4. B, Flower \times 2. D, Pod after opening \times 2_3 .

2. C. hæmatomma Benth. in Hook. Lond. Journ. Bot. iii. 103 (1844); stipular spines straight; pinnæ in 1 pair; leaflets in 4-8 pairs; peduncles of flower-heads axillary, solitary or rarely 2 together.—Benth. in Trans. Linn. Soc. xxx. 545. C. hæmatomma var. glabrata Griseb. op. cit. 224; Urb. Symb. Ant. ii. 263 & iv. 265 (under C. hæmatostoma). Acacia hæmatomma Bert. ex DC. Mém. Lég. 448, t. 68 (1825) & Spreng. Syst. iii. 137 (under hæmatostoma). Acacia americana siliquis teretibus &c. Sloane Cat. 152 & Hist. ii. 56 (in part).

Sloane Herb. vi. 43*2! Broughton! Shakspear! Masson! Wilson; March! road to Wareka, Long Mountain, 600 ft.; Great Goat Is., Harris! Fl. Jam. 8921, 9318.— Bahamas, Cuba, Hispaniola, Porto Rico, St. Thomas. A slender-stemmed straggling bush, trailing over shrubs or trees, or a low spreading tree up to 12 ft. high. Pinnæ '5-1.5 cm. 1.; leaflets

oblong, obtuse, unequal-sided, base rounded, 4-7 mm. l.; gland wanting. Peduncles 1.5-2 cm. l. Calyx 2 mm. l. Corolla 5 mm. l. Pod silky-

velvety, narrowing gradually to the base, 4-6 cm. l.

"Acacia pilosa DC. Prodr. ii. 455, Spreng. Syst. iii. 136 & Macf. Jam. i. 313, is described from Bertero's Jamaican specimens without flowers or fruit, which are probably luxuriant barren branches of C. hæmatomma, with 10 to 13 pairs of leaflets to the pinnæ" (Bentham).

3. C. comosa Benth. in Hook. Lond. Journ. v. 104 (1846); without spines or prickles; pinnæ in 3-2 pairs; leaflets in 8-10 pairs; peduncles of flower-heads in a raceme; racemes terminal, corymbose.—Griseb. op. cit. 225; Benth. in Trans. Linn. Soc. xxx. 551. Mimosa fruticosa erecta inermis, cortice cinereo, floribus laxe conglobatis, spicis plurimis comosis terminalibus, foliolis minimis bipinnatis Browne Hist. Jam. 253. M. comosa Sw. Prodr. 85 (1788) & Fl. Ind. Occ. 980. Inga comosa Willd. Sp. Pl. iv. 1026 (1806); Macf. Jam. i. 307. Pithecolobium? comosum Benth. in Hook. Lond. Journ. iii. 221 (1844).

Browne; somewhat rare, on rocks in the mountains of the north side, Swartz! Wilson.

A shrub or small tree, 7-20 ft.; stem weak, branching at the very top; branches subdivided, slender, straight, erect; without spines or prickles, glabrous. Pinnæ 4-5(-7) cm. l., with a glandular depression at the base of each. Leaflets sessile, broadly oblong, slightly tapering to the oblique obtuse apex, base broadly truncate, glabrous, veins prominent on both faces, shining on the upper, 10-12 mm. 1., 4-6 mm. br. Flowers sessile, 1.2-1.5 mm. 1.; teeth short, obtuse, 3-5. Corolla white (in bud), 4.5 mm. 1.; petals 3-5 (fide Sw.). Stamens (fide Sw.) 20-40, white. Pod scimitar-shaped, 5-7 cm. 1., minutely puberulous, 3-8-seeded.

Browne states: "This shrub resembles the wild Tamarind, both in its foliage and colour; but it is never observed to rise above seven or eight feet in height, rarely so much. The disposition of the flowers distinguishes it sufficiently from any of the rest."

46. ALBIZZIA Durazz.

Trees or shrubs without spines or prickles. Flower-heads pedunculate or subsessile; peduncles clustered or racemosepaniculate. Floral parts in 5's. Calvx campanulate or tubular, toothed or shortly lobed. Corolla tubular or funnel-shaped. Stamens indefinite, long exserted, united below; anthers small, aggregated into 2-4 masses in each cell. Pod broadly linear, straight or somewhat curved, not twisted, flat-compressed, thin, not splitting open or 2-valved, continuous within, not pulpy. Seeds roundish, compressed, attached by a long slender stalk.

Species about 100, natives of tropical and subtropical regions.

[A. lebbeck Benth. in Hook. Lond. Journ. Bot. iii. 87 (1844); pinnæ in 2-4 pairs: leaflets obliquely oblong, 1:5-4 or 5 cm. l., 5-2 cm. br., in 4-9 pairs; flowers shortly stalked in heads with long peduncles clustered 2-4 together; pod oblong, straight, swollen at the seeds, glabrous, ultimately opening.—Benth. in F/. Bras. xv. pt. 2, 428 & in Trans. Linn. Soc. xxx. 562; Watt Econ. Prod. i. 156; Urb. Symb. Ant. iv. 264; Willd. Sp. Pl. iv. 1066 (1806); Tussac Fl. Ant. iv. t. 29; Macf. Jam. i. 318; Griseb. Fl. Br. W. Ind. 223. Mimosa Lebbeck L. Sp. Pl. 516 (1753). M. speciosa Jacq. Ic. Pl. Rar. i. 19, t. 198. Type in Herb. Mus. Brit., also specimen from Jacquin.

Naturalized; Distin! Wilson; Prior; Harris!—Tropical and temperate Asia and Africa; introduced in the West Indies and South America.

Tree to 30 ft. high. Pinna: 5-2 dm.1.; leaflets large, unequal-sided, very

obtuse, very oblique at the base, subsessile. Gland on the common petiole. Peduncles generally 2-4 together. Flowers shortly stalked. Calyx puberulous, 3-5 mm. l. Corolla white, 7-10 mm. l. Stamens greenish-yellow, 3 times as long as the corolla. Pod 1.5-3 dm. l., 2.5-5 cm. br.

The wood seasons, works, and polishes well, and is fairly durable.

Used in India for furniture, sugar-cane crushers, oil-mills, canoes, house

posts, building, and fuel (Watt).

[A. julibrissin Durazz. in Mag. Tosc. iii. pt. 4, 11 (1772) ex F. Muell. in Journ. Bot. 1872, 7; pinnæ in 7-11 pairs; leaflets oblong, straight on the upper margin, curved on the lower. mucronate, midrib close to margin, 9-11 mm. l., 2.5-3.5 mm. br., in 20-40 pairs; flowers sessile in heads with long peduncles clustered 2-4 together in the axils or subracemose at the ends of branches; pod oblong, straight, swollen at the seeds, sometimes slightly and irregularly constricted between the seeds, glabrous. —Oliv. Fl. Trop. Afr. ii. 356; Bak. in Hook. f. Fl. Brit. Ind. ii. 300; Benth. iu Trans. Linn. Soc. xxx. 568. Mimosa julibrissin Scop. Delic. Insub. i. 18, t. 8 (1786). Acacia mollis Wall. Pl. As. Rar. ii. 76, t. 177 (1831) (pubescent var.). A. julibrissin Willd. Sp. Pl. iv. 1065 (1806); Griseb. loc. cit.; Wils. in Reports Geolog. Jam. 277.

Naturalized; Wilson!-Subtropical and temperate Asia, north-east tropical Africa; introduced into the Mediterranean region and many parts of America.

Tree. Pinna 4-7 cm. l. Gland on the common petiole. Calyx more or less puberulous, 2-3 mm. l. Corolla 6-8 mm. l. Stamens rose-red, about 4 times as long as the corolla. Pod 10-15 cm. l., 1·7-2·5 cm. br.

The wood is used in India to make furniture (Watt).]

A. Berteriana comb. nov.; pinnæ in 9-15 pairs, leaflets oblonglinear, 4-8 mm. l., in 30-40 pairs; flowers sessile in small heads; heads shortly stalked, racemose-paniculate; pod straight, minutely puberulous, not opening, with blunt margin.—Pithecolobium Berterianum Benth. in Hook. Lond. Journ. Bot. iii. 220 (1844); Walp. Rep. v. 620; Urb. Symb. Ant. ii. 261. P. fragrans Benth.

loc. cit. (1844) & in Trans. Linn. Soc. xxx. 592; Walp. Rep. v. 619.
Acacia Berteriana Balb. ex DC. Prodr. ii. 470 (1825); Griseb.
Fl. Br. W. Ind. 223. Inga fragrans Macf. Jam. i. 309 (1837);
Walp. Rep. i. 931.

Sloane Herb. vi. 40a! Lane in Herb. Sloane clxii. 267! below Mocha and Chesterfield Works, Macfadyen! Mount Lebanon, 2500 ft.; Malvern, 2200 ft.; coast between Portland Point and Rocky Point; Harris! Fl.

Jam. 5895, 9654, 9946, 10,190.—Cuba, Hispaniola.

A spreading tree, 20-30 ft. high; twigs, petioles, and peduncles glabrous or minutely puberulous. Leaf 1-2·5 dm. l. Pinnæ 4-8 cm. l. Leaflets somewhat unequal-sided especially at the base, lighter-coloured beneath. Gland oblong above the base of the petiole, and a roundish one between the terminal pair (or pairs) of pinnæ, and also at the ends of the pinnæ. Flowers greenish or white, fragrant. Calyx 1·5 mm. l. Corolla twice as long as calyx. Stamens twice as long as the corolla. Pod 7-12 cm. l., 12-15 mm. br.; stalk 6-10 mm. l., about 10-seeded. Seeds flat, discoid, about 5 mm. in diam.

47. PITHECELLOBIUM Mart.

Shrubs or trees, with or without spines. Pinnæ in 1 or several pairs; leaflets in 1 or many pairs. Flowers generally in globular heads, or rarely spicate, or, in *P. Alexandri*, in a spike-like raceme, white, generally hermaphrodite; floral-parts usually in 5's. Calyx campanulate, shortly toothed. Corolla funnel-shaped. Stamens few or numerous, long exserted, united at the base or higher into a tube; anthers small, pollen usually aggregated into 2–4 masses in each cell. Pod compressed, curved and twisted, continuous within, valves opening.

Species about 60, dispersed through the tropics.

Pinnæ in 1 pair. Leaflets in 1 pair. Stipules spiny.

Inflorescence glabrous. Corolla 5-6 mm. l. 1. P. unguis-cati.

[Inflorescence white-tomentose. Corolla 2:5-3 mm. l. P. dulce.]

Pinnæ in more than 1 pair. Leaflets in more than 1

Flowers in globular heads ... 2. P. arboreum. Flowers in spike-like racemes ... 3. P. Alexandri.

1. P. unguis-cati Benth. in Hook. Lond. Journ. Bot. iii. 200 (1844); glabrous, stipules spiny, straight, small or minute, sometimes wanting; pinne in one pair, leaflets in one pair; flowers sessile in heads; heads globular or shortly lengthened into a spike in axillary racemes or terminal panieles; pod slightly constricted between the seeds, continuous within, red outside and inside, spirally curved, sometimes of 2 or 3 circles, valves much twisted; seeds black with a white aril.—Benth. in Trans. Linn. Soc. xxx. 572; Griseb. Fl. Br. W. Ind. 226; Sarg. Silv. iii. 133, t. 145; Urb. Symb. Ant. iv. 263. Acaciæ quodammodo accedens et Ceratiæ &c. Pluk. Phyt. t. 1, f. 6. Acacia arborea major spinosa &c. Sloane Cat. 152 & Hist. ii. 56.

States 116 (1860). (Fig. 45.)

Black-bead shrub.

St. Jago de la Vega, Sloane Herb. vi. 45, 46! Houstoun! Wright! Masson! Bancroft! Purdie; Macfadyen; Falmouth, Miss A. Moulton Barrett! between Kingston and Salt Ponds, Fawcett! near Falmouth;

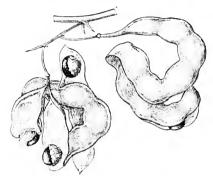

Fig. 45.—Pithecellobium unguis-cati Benth.

Pods, one just opening, the other quite open, showing the seeds with aril, nat. size.

Heathshire Hills; Corby, S. Cruz Mts., 1200 ft.; Salem, Llandovery, St. Ann; *Harris*! Fl. Jam. 7238, 9534, 9745, 10,376, 11,625.—Florida and

Keys, Bahamas, West Indies, Venezuela, Colombia.

A glabrous shrub or small tree, 10-15 ft. high; common petiole ·5-3·5 cm. l.; petiolule 3-8 mm. l. Leastets obliquely obovate or elliptical, or oblong-lanceolate, varying much in size, 1-4·5 cm. l. and more. Gland between the pinme and between the featlets. Flower-heads stakled, in axillary racemes, or terminal panicles. Calyx 1·5 mm. l. Corolla 5-6 mm. l., greenish-yellow. Stamens, 3 time as long as the corolla, pale yellow or sometimes rosy or purplish. Pod 7-10 mm. br. Seeds 5-7, black, shining, roundish, half covered with a white fleshy aril.

[P. dulce Benth. in Hook. Lond. Journ. iii. 199 (1844); like P. unquis-cati, but a tree to 50 ft. high; it also differs in the creamy-white corolla being only half as long, 2·5–3 mm. l., and the inflorescence, instead of being glabrous, is covered with whitish tomentum.—Mimosa dulcis Roxb. Pl. Corom. i. 67, t. 99 (1795). Inga dulcis Willd. Sp. Pl. iv. 1005 (1805); Wight Ir.

An original specimen from Roxburgh in Herb. Mus. t. 198. Brit.

Naturalized in Liguanea plain, Harris! Fl. Jam. 12,325, 12,336.— America and northern S. America, introduced into the rest of the tropics.

2. P. arboreum Urb. Symb. Ant. ii. 259 (1900) & iv. 264; pinnæ in 8-16 pairs, leaflets in 20-30 pairs; flowers sessile in a globular head; peduncles 1-3 together in the axils or a short distance above; pod somewhat fleshy, continuous within, much constricted between the seeds, scarlet, curved or twisted; valves blood-coloured inside.—P. filicifolium Benth. in Hook. Lond. Journ. Bot. iii. 205 (1844) & in Trans. Linn. Soc. xxx. 589; Griseb. op. cit. 226. Mimosa arborea L. Sp. Pl. 519 (1753); Sw. Obs. Bot. 390. Acacia arborea Willd. Sp. Pl. iv. 1064 (1806) (excl. syn. L. Sp. Pl. 1503 & Miller Dict.); Macf. Jam. i. 320. A. arborea maxima &c. Sloane Cat. 151 & Hist. ii. 54, t. 182, f. 1, 2. A. non spinosa jamaicensis &c. Plul. Phyt. t. 251, f. 2. Mimosa arborea cortice &c. Browne Hist. Jam. 252. M. arborea L. Herb. & Sp. Pl. ed. 2, 1503 (descr. only) is Acacia villosa Willd. Type in Herb. Mus. Brit.

Wild Tamarind.

Sloane Herb. vi. 41! Barham in Herb. Sloane clxii. 268! Wright! Broughton! Swartz! "common in the mountains," Macfadyen; Distin! near Bath, Purdie! Prior! March! Lucea, Hitchcock; above Gordon Town, 1400 ft., Harris! near Hope, Bot. Dept.! Fl. Jam. 6791, 8294.—

Cuba, Hispaniola, Porto Rico, Central America.

A spreading tree, 40-60 ft. high, 3-4 ft. in diam.; twigs, petioles, and peduncles rusty-pubescent. Common petiole 3-13 cm. l.; petiolule 3-10 cm. l. Leaflets oblong-lanceolate, glabrous, 6-9 mm. l. Glands petiolar and between each pair of pinnæ. Peduncles 3-8 cm. l. Flowers whitish flesh-coloured. Calyx coloured, 2 mm. l. Corolla 6-7 mm. l. Stamens barely twice as long as corolla. Pod, when young, velvety, when older, glabrate, 7-12 cm. l., 8-12 mm. br. Seeds spherical or ellipsoidal, black, estiming 2 19 mm. shining, 8-12 mm. l.

It saws freely, is not too hard for general work, is beautifully grained, takes a fine polish, and is in general use for floorings, ceilings, and ornamental work. Altogether it is an excellent timber, and very useful in

building.

3. P. Alexandri Urb. Symb. Ant. v. 358 (1908) (incl. vars.); pinnæ in 3-9 (1-2) pairs, leaflets in 3-14 pairs; flowers stalked, in a spike-like raceme; pod subsessile, spirally twisted, slightly constricted between the seeds but continuous within, reticulateveinv; valves on the inside yellowish, but red or brownish where the seeds occur.—P. micradenium Griseb. Fl. Br. W. Ind. 226 (1860) (in part); Benth. in Trans. Linn. Soc. xxx. 584 (in part). P. Jupunba Urb. var. Alexandri Urb. Symb. Ant. ii. 258 (1900).

Shag Bark, Shad Bark, Tamarind Shad Bark. Wright! Moneague, Prior! Holly Mount, Mt. Diablo, 2500 ft.; Lapland, near Catadupa, 1500 ft.; edge of Great Morass, Negril; near Troy, 1800-2500 ft.; Dolphin Head, 1200 ft.; Malvern to Mountain Side, 1200 ft.; Stanmore Hill, 2200 ft.; Kempshot, 1500 ft.; Harris! Fl. Jam.

8800, 8960, 8975, 9077, 9182, 9263, 9921, 9948, 10,243, 10,329.

Tree 30-40 ft. high. Leaves 7-12 cm. l. Leaflets unequal-sided, very variable in form and size, rhomboid or obliquely elliptical, '8-5 cm. l., '4-3 5 cm. br., with a close network of veins on both sides, glabrescent; pinna 4-10 cm. l. Glands between each pair of pinnæ and usually below each pair of leaflets. Peduncles 1 or 2 in the axils of leaves, 3-10 cm. l. Racemes 3-7 cm. l., densely or laxly flowered. Flowers pale yellow or greenish yellow, fragrant; pedicels 4-1 mm. l. Calyx 2-3 mm. l. Corolla about twice as long as the calyx. Stamens twice as long as corolla. Seeds white, with a horse-shoe-shaped greenish-blue mark opposite the attachment on each face, lens-shaped, almost round, about 7 mm. in diam.

48. ZYGIA P. Browne.

Trees without spines. Pinnæ in 1 pair; common petiole very short. Leaflets large, in 1-5 pairs. Glands between the pinnæ,

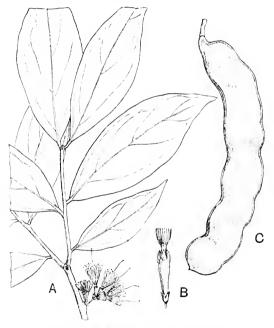

Fig. 46,-Zygia latifolia Fawc. & Rendle.

A. Leaf and inflorescence $\times \frac{1}{2}$.

B. Flower with the stamens cut off above $\times 2$.

C. Pod $\times \frac{1}{2}$.

and between the leaflets. Flowers in heads or spikes at the nodes of branches which have dropped their leaves, similar to those of *Pithecellobium*; peduncles wanting or short, clustered.

Pod continuous within, flat-compressed, with the edges sometimes more or less undulate-curled, leathery and stiff, straight or curved, tardily opening.

Species about 14, natives of tropical continental America,

one species also in the West Indies.

This genus is Bentham's section Caulanthon of Pithecellobium, with the exception probably of the last two species mentioned in his monograph in Trans. Linn. Soc. xxx. 593.

Z. latifolia comb. nov. Zygia arborescens &c. Browne Hist. Jam. 279, t. 22, f. 3. Acacia non spinosa folis juglandis flore purpureo Plum. Cat. 17, Ic. ined. iv. 207 & Pl. Amer. (Burm.) 5, t. 9. (Fig. 46.)

Horse Wood, Hoop Wood.

Very common, St. Mary, Browne; Agualta Vale river course, McNab! Wilson! Wag Water, St. Andrew, March! Mount Dakin; Castleton; Harris! Fl. Jam. 5610.—Martinique, St. Vincent, Trinidad, Panama,

northern South America.

Shrub or tree, 10-25 ft. high, glabrous. Leaflets in 1 or 2 pairs with an odd leaflet below, the lower leaflets not opposite, elliptical, narrowing to the apex and to the oblique base, the highest 7-12(-15) cm. l., 2.5-5 cm. br., the lower on the pinna smaller. Stipules sometimes persistent, acute, 3-4 mm. l.. Common petiole very short, 7-3 mm. l. or still shorter; rhachis of the pinna 2-12 cm. l. Gland between the pinnae, and between the terminal leaflets. Flower-heads lax-flowered, subsessile or shortly stalked, densely clustered. Flowers crimson or purplish. Calyx campanulate, 1.5 mm. l. Corolla tubular, increasing in width upwards, toothed, 6-7 mm. 1. Stamens more than twice as long as the corolla, tube exceeding the corolla in length by about 2 mm. Pistil nearly as long as the stamens. Pod curved slightly, 1-3 dm. l., 2-2.5 cm. br.

49. ENTEROLOBIUM Mart.

Trees, with or without spines. Pinnæ and leaflets in few or numerous pairs. Flowers sessile or shortly stalked, in globular heads. Peduncles axillary, solitary or in clusters of 2-5. Floral parts in 5's. Calyx campanulate to tubular, shortly toothed. Stamens indefinite, united below, exserted; pollen aggregated into 2-4 masses in each cell. Pod straight or curved, not twisted, thick, pulpy or more or less spongy and dry, or leathery, not or scarcely opening, with partitions between the seeds.

Species about 12, natives of tropical America.

The genus as amended here includes not only those species

given by Bentham in his monograph of Mimoseæ in Trans, Linn, Soc. xxx. 598, but probably most of the species of his section Chloroleucon of Pithecellobium and his P. saman Benth.

Pinnæ in 4-10 pairs.

Leaf 8-7 cm. l. Pod broad, forming a circle 1. E. cyclocarpum. Leaf 3-7 cm. l. Pod strap-shaped, curved 2. E. mangense. [Pinne in 2-4 pairs. Pod thick, fleshy, straight..... E. saman.]

1. E. cyclocarpum Griseb, Fl. Br. W. Ind. 226 (1860); without spines; pinnæ in 4-9 pairs; leaflets small, in 20-30 pairs; flowers sessile in small heads; peduncles somewhat long; pod curved to form a complete circle, about 10 cm. in diam.—Benth. in Trans. Linn. Soc. xxx. 598. Mimosa cyclocarpa Jacq. Fragm. t. 34, f. 1 (1800–1809). Inga cyclocarpa Willd. Sp. Pl. iv. 1026 (1806); Macf. Jam. i. 308. Pithecollobium cyclocarpum Mart. in Flora xx. ii. Beibl. 115 (1837) in obs.

Purdie! near Spanish Town bridge, Macfadyen! McNab; Castleton, Thompson! Ferry River, Harris! Fl. Jam. 7248, 10,383.—Central America, northern South America. Perhaps not distinct from E. timbouva Mart.

from Brazil and Paraguay.

Tree 30-60 ft. high, subglabrous. Leaf 8-17 cm. l., pinna 4-10 cm. l. Leaflets oblong, slightly curved, 8-13 mm. l., unequal-sided as the midrib is submarginal, ending in an acute point, base truncate, glaucous beneath. Gland oblong, near base of petiole, and roundish-elliptical between the two uppermost pair of pinne. Peduncles 3-5 in a cluster, axillary, 3.5-5 cm. l. Flowers greenish-yellowish. Calyx 2-2.5 mm. l. Corolla 4.5-5 mm. l. Stamens white, about twice as long as corolla.

2. E. mangense comb. nov.; spines 1 or 2, here and there, in a few of the leaf-axils, and especially in the axils of twigs; pinna in 5-10 pairs; leaflets small, in 20-25 (10-30) pairs; flowers sessile in small heads; heads shortly stalked; pod flat, leathery, curved, somewhat thick, veiny, glabrous; valves opening.-P. parvifolium Benth, in Hook, Lond, Journ. Bot. iii. 223 (1884), iu Fl. Bras. av. pt. 2, 454 & in Trans. Linn. Soc. xxx. 597. Mimosa mangensis Jacq. Enum. Pl. Carib. 34 (1760), Sel. Stirp. Amer. 267, Ed. pict. t. 262, f. 70; Sw. Prodr. 85. Samanea saman Merrill in Journ. Wash. Acad. Sc. vi. 47 (1916).

Guango.

Naturalized; Salt Ponds, Macfadyen; Spanish Town; Moneague; Prior! Porus, Lloyd; Lucea, Hitchcock; Hope, Harris! Fl. Jam. 9276.—Naturalized or cultivated throughout the West Indies; native of Central and S. America.

A spreading tree, 40 ft. high; twigs, petioles, and peduncles pubescent. Common petiole and rhachis of leaf 10-15 cm. l.; rhachis of pinnæ 3-12 cm. l. Leaflets at the apex of leaf in 6-8 pairs, gradually fewer to the base, obovate or oblong or obliquely rhomboid, apex blunt or rounded, the largest at the apex of the pinnæ, 4·5 cm. l., gradually smaller towards the base, to 1·5 cm. l., pubescent beneath. Glands between the pinnæ and between the leaflets. Peduncles 5-9 cm. l. Calyx 6 mm. l. Corolla nearly twice as long, yellowish. Stamens numerous, 3 times as long as the corolla, light crimson. Pod 1·5-2·5 dm. l., 1·5-2 cm. br. Seeds to 25, separated from each other, and enclosed by a skin-like tissue, outside which is pulp.

The wood is hard and ornamental, but cross-grained and difficult to saw. The pods are eaten by cattle, and the tree is spread by means of the seeds in the droppings. The species is said to have been introduced by this natural means with cattle from the mainland. The tree is most useful in pastures, not alone for fodder, but for the shade it affords.]

49. INGA Willd.

Unarmed trees or shrubs. Leaves abruptly pinnate, leaflets in few pairs, large. Flowers large, in spikes or racemes. Floral parts in 5's. Calyx tubular or campanulate, toothed or shortly lobed. Corolla tubular or funnel-shaped. Stamens numerous, long exserted, united below into a tube; tube nearly as long as, or sometimes longer than, the corolla; pollen aggregated into 2 or 4 masses. Pod not opening or irregularly bursting, thickish, enlarged on the margins, 4-angled; seeds enclosed in pulp.

Species 140, natives of tropical America and of subtropical

South America.

I. vera Willd. Sp. Pl. iv. 1010 (1806); Macf. Jam. i. 306; Griseb. Fl. Br. W. Ind. 228; Benth. in Fl. Bras. xv. pt. 2, 494 &

in Trans. Linn. Soc. xxx. 627; Urb. Symb. Ant. iv. 263. Arbor siliquosa brasiliensis &c. Sloane Cat. 153 & Hist. ii. 58, t. 183, f. 1. Mimosa inga L. Sp. Pl. 516 (1753); Sw. Obs. Bot. 388. M. foliis pinnatis &c. Plum. Pl. Amer. (Burm.) t. 25. (Fig. 47.)

Banks of Rio Nuevo, Sloane Herb. vi. 51! Wright! Broughton! St. Ann, Purdie! Oersted! Wilson! March! Elmwood, Hart! Priestmans River, Deans! Castleton, Thompson! Port Morant, Hitchcock; Spring, St. Thomas; Moore Park, Portland, 1500 ft.; New Ground, St. Ann; Harris! Fl. Jam.

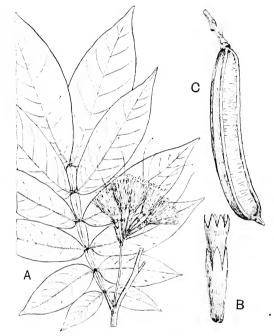

Fig. 47.—Inga rera Willd.

A, Leaf and inflorescence \times 1. B, Calyx and corolla, nat. size. C, Pod \times 1.

5406, 6613, 8013, 10, 364.—Hispaniola, Porto Rico, Trinidad. Central America, northern South America.

Tree 20-40 ft. high, tomentellous. Leaflets in 4-6 pairs, elliptical-oblong to lanceolate, sometimes obovate, usually acuminate, 4-13 cm. l. Petiole winged between the pairs. Gland circular, between the leaflets of each pair. Flowers sessile or subsessile, in spikes. Calyx 9-13 mm. l. Corolla white, 13-16 mm. l. Filaments white, more than twice as long as the corolla; tube shorter; anthers green. Pod 10-12(-15) cm. l., 12-20 mm. br., tomentose, slightly curved, 4-ribbed.

The specimen in Herb. Sloane corresponding to Sloane's description and figure cited by Linneus consists merely of the pod. We find no

indication of the regular dehiscence of the pod, nor of the terminal leaflet depicted by Sloane.

Grisebach cites Bentham as the authority for the occurrence of *I. ingoides* Willd. in Jamaica, but we find no confirmation of this, nor have we seen specimens. It differs from *I. vera* Willd. in the flowers being stalked, the spikes corymbose, calyx 6-7 mm. 1., corolla twice as long as the calyx, and the pod longer and deeply furrowed.

FAMILY XL. GERANIACEÆ.

Herbs or shrubs; branches swollen at the nodes. Leaves simple, stipulate. Sepals and petals 5, generally distinct and imbricate. Stamens 10 or 15 (5), often united at the base. Ovary 5-celled; carpels united with the axis, produced above into a beak with the styles more or less combined with it. Fruit a capsule separating elastically into 5 one-seeded parts (cocci). Endosperm thin or none.

Species about 630, natives of temperate and subtropical regions of the whole world, a few in the mountains of the tropics.

GERANIUM L.

Herbs. Leaves palmately lobed. Flowers regular, parts in 5's. Glands 5, alternate with petals. Stamens twice as many as petals. Ovary 5-celled; stigmas 5; ovules 2 in each cell. Ripe carpels separating from the central axis elastically usually from base to apex, and recurved. Cotyledons induplicate-plicate or convolute; radicle incumbent.

Species about 260, natives of the temperate regions of the whole world, only found in the tropics in the mountains.

G. carolinianum L. Sp. Pl. 682 (1753); Hanks & Small in N. Amer. Fl. xxv. 9; Knuth in Engl. Pflanzenreich iv. 129, 54. G. columbinum carolinum &c. Dill. Elth. t. 135. G. lanuginosum Jacq. Hort. Schoenbr. ii. 8, t. 140 (1797). G. pyrenaicum Griseb. Fl. Br. W. Ind. 132 (1859) (non Burm. f.) (see Urb. Symb. Ant. vi. 96); Hanks & Small tom. cit. 10 (with reference to Jamaica). (Fig. 48.) Type in Herb. Gronovius in Herb. Mus. Brit.; specimen named by Linnæus in Herb. Linn.

Near Coldspring, Swartz! McNab! Abbey Green, Prior; Cinchona, J.P. 947, 1398, Hart! Blue Mt. Peak, Hitchcock; Clydesdale; Cinchona, 5000 ft.; below Newcastle, 3800 ft.; Green Valley, St. Andrew, 2000 ft.; Harris! Fl. Jam. 8577, 11,939, 12,388.—Southern Canada, U. States, northern Mexico, Bermuda.

Annual or biennial, pubescent. Stem branching, erect or ascending, to 1½ ft. high. Leaves 3-6 cm. br., divided almost to the base into 5-7 segments; segments pinnately cleft into linear lobes; petioles long. Inflorescence with the peduncles and flowers somewhat crowded and

corymbose. Pedicels with glandular hairs. Sepals tipped with a long mucro (1-2 mm. l.), 5-7 mm. l., often even to 8 mm. l. in fruit. Petals white tinged with pink, barely as long as the sepals. Beak of fruit

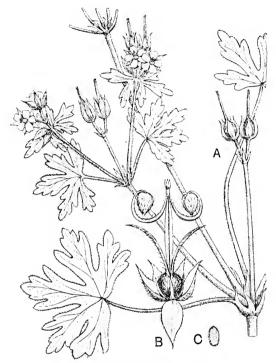

Fig. 48.-Geranium carolinianum L.

A, Shoot bearing flower and fruit × 3. B, Fruit with valves separating elastically from the central column in both directions \times 2. C, Seed \times 3.

12-18 mm. l., pubescent, hairs generally spreading. Valves smooth, with shaggy hairs, separating partly from base to apex, and partly from apex to base. Seeds with finely reticulate markings.

FAMILY XLI. OXALIDACEÆ.

Herbs, shrubs, or trees. Leaves compound, alternate. Stipules free from the petiole, or not, or wanting. Sepals 5, imbricate. Petals 5, twisted in bud. Stamens 10, united at the base; filaments alternately unequal, 5 opposite the sepals longer. Ovary 5-celled; styles 5, distinct, with terminal capitate

stigmas; ovules in the inner angle of each cell, one to numerous. Fruit 5-celled, a capsule in Oxalis, or a fleshy berry in the cultivated Averrhoa. Seeds generally covered with an aril. Endosperm fleshy; embryo straight.

Species about 310, mostly in tropical and subtropical America.

and in S. Africa, very few throughout the tropics, and also very

few in the temperate regions.

OXALIS L.

Herbs. Leaves digitately 3-foliolate (in W. Indian species); leaflets sensitive to light, drooping as the light disappears. Ovules numerous in Jamaican species. Fruit a capsule, opening loculicidally. Seeds covered by a white fleshy aril which bursts elastically when they are ripe, and by its contraction expels them; testa transversely ridged, or minutely tuberculate.

Species about 300, growing in tropical and subtropical America, and also in S. America beyond the tropics, and in South Africa, very few occurring elsewhere in the tropics or in

temperate regions.

Flowers yellow, 1 or 2 on an axillary peduncle 1. O. corniculata. Flowers rosy, several, corymbose or umbellate, on peduncles springing from the ground 2. O. corymbosa.

1. O. corniculata L. Sp. Pl. 435 (1753); stems decumbent or creeping, rooting at the nodes and giving off ascending branches; flowers yellow, 3, 2, or 1, on an axillary peduncle.—

Jacq. Oxal. 10, t. 5; Griseb. Fl. Br. W. Ind. 133; Prog. in Fl. Bras. xii. pt. 2, 492; Urb. Symb. Ant. iv. 312. O. caule &c. Browne Hist. Jam. 231. O. repens Thunb. Oxal. 16 (1781); Jacq. Oxal. 31, t. 78, f. 1; Robinson in Journ. Bot. xliv. 387.

Sorrel.

A common weed in provision grounds, coffee pieces, gardens, etc.; Browne! Macfadyen; St. Thomas in the Vale; St. Mary; McNab! J.P. 1222, Hart! Bog Walk, Hitchcock; Providence, 700 ft., Thompson! waste places, Castleton, 500 ft., Harris! Fl. Jam. 8059, 11,009, 12,335, 12,384.— All tropical and temperate regions.

Sloane collected this species in Madeira on his voyage to Jamaica, but

not in Jamaica. See Herb. iv. 25.

A variable annual herb. Stems '5-3 dm. and more, pubescent or glabrescent. Leaflets broadly obcordate, more or less pubescent, margin sometimes ciliate, 1-1.5 cm. br.; petioles pubescent or glabrescent, 2-4 cm. l. Stipules not free from the petiole, ciliate, 1.5-2 mm. l. Peduncles more or less as long as, or longer than, the petiole, puberulous

or glabrate. Pedicels '7-1.5 cm. l. Bracteoles at base of pedicels, 2-4 mm. 1., linear-lanceolate. Sepals 2-4 mm. 1., hairy. Petals 4-9 mm. 1. Filaments glabrous. Capsule 9-17 nm. l., linear-oblong, puberulous-velvety, abruptly narrowed at the apex. Seeds transversely ridged, 1.3 mm, l., reddish-brown.

2. **0.** corymbosa *DC. Prodr. i.* 696 (1824); stemless, leaves and peduncles springing from a compound bulb; flowers rosy, corymbose or umbellate.—Bak. Fl. Maur. 37. O. Martiana

Kingston; Bog Walk; *Hitchcock*; near Castleton; Hope grounds: *Harris*! Fl. Jam. 6870, 12,334.—St. Vincent, Central America, tropical and subtropical S. America, introduced into many places in the Old World.

Stemless crown from which 20 or more leaves and several scapes arise, surrounded by numerous bulbils. Leaflets broadly obcordate, more or less pubescent and ciliate, glandular-dotted beneath, 1.5-3 cm. br.; petioles 1-2 dm, l, and more; stipules represented by expansions of the petiole. Scapes longer than the leaves, many-flowered. Pedicels ·5-2 cm. l. Bracteoles at base of pedicels. Sepals with 2 elongated glands at the apex, 4-5 mm. l. Corolla pink, turning violet in decay and in drying, 1-1·5 cm. l. Stamens: the longer pubescent. Styles densely hairy. Capsule (not seen) "oblong, many-seeded, downy" (Baker).

Averrhoa Carambola L. & A. bilimbi L., natives of tropical Asia, are sometimes cultivated.

FAMILY XLII. LINACEÆ.

Herbs or shrubs. Leaves alternate, simple, usually entire. Flowers perfect, regular, in racemes or in panicled or corymbose cymes. Parts of the flower in 5's. Sepals imbricate. Petals imbricate, generally twisted in bud, fugacious. Stamens generally 5, united below, hypogynous. Staminodal glands 5, on the staminal column. Ovary free, entire, 3-5-celled. Ovules 1 or 2 in the angle of each cell. Styles 3-5. Fruit capsular. Embryo generally straight and as long as the endosperm.

Species about 150; the herbaceous species natives chiefly of the temperate regions; the shrubby species principally in the

tropics; very few in Australia.

LINUM L.

Herbs, sometimes shrubby. Leaves sessile, narrow. Stipules wanting or represented by glands. Staminodal glands opposite the petals. Ovary generally 5-celled; ovules 2 in each cell; styles generally 5. Capsule septicidally 5-valved, 5-celled. Endosperm scanty.

Species about 90, natives of temperate and subtropical regions of the whole world, ascending to the mountains in the

tropics of the New World.

L. jamaicense comb. nov.; Cathartolinum jamaicense Small in Torreya xiii. 63 (1913). (Fig. 50.)

Amongst grasses, in damp places, Crofts Hill to the savannas on the northern slopes of Bull Head, Clarendon, 2000 ft.; Hollis's savanna, Upper Clarendon, 2400 ft.; Harris! Fl. Jam. 11,159, 12,243.

Perennial herbs, 9 ins. to 2 ft. high. Stem erect, slender, glabrous, generally simple. Leaves more or less erect, 6-12 mm. 1., linear. Flowers in interrupted spike-like racemes. Sepals about 3 mm. 1., outer lanceolate, without glands, inner narrowly elliptical, often minutely glandular-tecthod. Betelv replace 4.5.7.5. mm. 1. Newsfersion. toothed. Petals yellow, 4.5-7.5 mm. l., very fugacious. Staminodia wanting. Capsule globular-ovoid, longer than the sepals.

FAMILY XLIII. ERYTHROXYLACEÆ.

Glabrous shrubs or trees. Leaves alternate, simple, entire. Flowers white, one to several, in axils of leaves, sometimes appearing before the leaves, regular, perfect but sometimes anthers or pistil infertile; parts in 5's. Calyx persistent; segments 5, imbricate. Petals 5, free, deciduous, generally with a ligule at the base. Stamens 10, filaments united below into a cup. Ovary 3-celled, with 1 or 2 pendulous ovules in each cell. Styles 3, usually with terminal capitate stigmas. Fruit drupaceous. Seed generally with endosperm; embryo straight.

Species nearly 200, natives of the West Indies and tropical and subtropical S. America, and Africa, very few in the East

Indies and Australia.

ERYTHROXYLON L.

Stipule one, within the petiole, persistent, occurring frequently though the leaf is undeveloped, broadly triangular (lanceolate in E. obovatum), 2-ridged. Flowers often dimorphic, heterostyled. Calyx: segments triangular. Petal consisting of a blade and a claw, with a broad scale or ligule attached on the inside where the blade and claw unite. Ovary 3-celled with 2 cells abortive; ovule solitary. Styles 3, distinct or united at the base. Drupe red, with 1 seed.

Species nearly 200; distribution as in Family.

Leaves with							E areolatum
2 longitudinal veins							

redicers stender throughout. Apex of leaves

Leaves roundish-obovate, '5-3'5 cm. l. 2. E. rotundifolium.
Leaves elliptical, 2'5-7 cm. l. 3. E. obovatum.

Pedicels thickened upwards.

Tree 12-25 ft. high. Petioles 4-8 mm. l. Stipules 2-6 mm. l. Flowers 6 (1-10), in the axils. Pedicels 1-4 mm. l., slightly thickened above. Calyx about 2 mm. l.; segments 1 mm. l. Petal: blade elliptical, flat, keeled on the back, about 2.7 mm. l.; claw .8 mm. l., .5 mm. br.; ligule about 1.2 mm. l., of 2 lateral concave lobes united from their backs, with the inner edge decurrent on the claw.

4. E. incrassatum O. E. Schulz in Urb. Symb. Ant. v. 210 (1907); leaves elliptical, base cuneate, apex acute or slightly and shortly acuminate, 8-10 cm. 1.; 3.5-4.5 cm. br.; pedicels thickened upwards, passing gradually into the calyx.—O. E. Schulz in Engl. Pftanzenreich iv. pt. 134, 101. E. havanense Sw. Obs. Bot. 185 (1791) (non Jacq.). E. squamatum Griseb. op. cit. 114 (1859) (as regards the Jamaican plant) (non Vahl).

Swartz! Prior!

Petioles 6-8 mm. 1. Stipules 1-1.5 mm. 1. Flowers 1-3 in the axils. Pedicels 8-10 mm. 1. Calyx about 1.5 mm. 1.; segments about 1 mm. 1. Petals obovate-oblong, 4-4.5 mm. 1. (incl. claw up to 1 mm. 1.); ligule 1.5-2 mm. 1., 2 lobes on each side, the exterior lobes the longer, denticulate, with an obtuse lobe joining them on the outside, the interior lobes united by a lobe turned downwards on the inside. Staminal tube shorter than the calyx. Drupe unknown.

5. E. jamaicense Fauc. & Rendle in Journ. Bot. lv. 38 (1917); leaves elliptical, apex and base rounded, 4-7 cm. l., 2·5-4 cm. br.; pedicels thickened upwards, passing gradually into the calyx. Type in Herb. Jam.

Peckham Woods, Clarendon, 2,500 ft., Harris! Fl. Jam. 11,203.

Tree 15 ft. high. Petioles about 1 cm. l. Stipules 2-3 mm. l., persistent triangular-ovate, not keeled, apex erect, shortly aristate. Flowers 1-2 in the axils. Pedicels 3-4 mm. l. Calyx 1·5 mm. l.; segments slightly over 1 mm. l. Petals oblong, nearly 3 mm. l. (incl. claw 1·3 mm. l.); ligule folded just above the middle, upper portion reflexed, 2-lobed, the fold forming a crenulate pocket, length from union of claw and lamina to fold 1 mm. Staminal tube slightly shorter than the calyx. Stigmas capitate. Drupe linear-oblong, curved, 1·3 cm. l., 2-2·5 mm. br.

FAMILY XLIV. ZYGOPHYLLACEÆ.

Herbs, shrubs, or trees. Leaves opposite, or alternate by abortion of one of the pair, abruptly pinnate, stipulate; leaflets entire. Peduncles 1, or 2 together, or often more in Guaiacum, 1-flowered. Flowers hermaphrodite, sepals and petals usually 5, imbricate, distinct. Stamens generally 10, distinct. Ovary 2–12-celled; styles combined into one; ovules 2 to many, more rarely 1, pendulous or ascending, with ventral raphe and superior micropyle. Fruit composed of 2–12 cocci; cocci 1- or few-seeded. Endosperm horny, thick, scanty, or wanting. Embryo as long as the seed, green, straight; cotyledons oblong or linear, somewhat thick or leafy.

Species, about 160, natives of the tropical and warm regions,

chiefly of the northern hemisphere, very rare in tropical Africa, wanting in Further India and in the Malay Archipelago.

Trees. Fruit fleshy at first, angled or winged... 1. Guaiacum. Herbs. Fruit dry.

Sepals deciduous. Fruit spiny................................ 2. Tribulus. Sepals persistent. Fruit tuberculate.............. 3. Kallstroemia.

1. GUAIACUM L.

Trees or shrubs, with hard resinous wood; twigs often with swollen or jointed nodes. Leaves abruptly pinnate; leaflets leathery, in 2-14 pairs; stipules minute, caducous. Peduncles 1-flowered, solitary or 2 or more, with minute deciduous bracts at the base. Sepals unequal. Petals obovate. Ovary stalked, 2-(5) celled; ovules 8-10 in each cell, pendulous. Fruit somewhat fleshy on the outside, composed of 2(-5) cocci; cocci angled or winged on the back, separating at length, 1-seeded. Endosperm horny, with chinks; embryo straight; cotyledons leafy.

Species 4, natives of tropical and subtropical America.

Lignum Vitæ. Barham in Herb. Sloane clxxxiv. 164! Sloane Herb. vii. 78! Browne! Broughton! Shakspear! plains on the south side, Macfadyen! St. Andrew, McNab! Parnell! Purdie! Port Henderson, Lane! Prior! March! Liguanea plain, J.P. 616, Morris! Kingston, Hitchcock; also Plaxton! and Clute! Long Mountain road, Campbell! also Harris! Fl. Jam. 6411, 8639 (fls. white), 8640 (fls. blue).—West Indies, northern S. America.

Tree, usually not more than 12-15 ft. high, with diameter not often

exceeding $1\frac{1}{2}$ ft. Leaflets in 2(-3) pairs, sessile, elliptical to obovate-elliptical, rarely oblanceolate-elliptical, glabrous, nerves and veins prominulous on both sides, 1.5-5 cm. l.; stipules puberulous, 1 mm. l. Peduncles few or often crowded, as many as 10 in a cluster, axillary, at ends of twigs, 1.5-3 cm. l. Sepals 5, white-tomentose inside and out, 4-5 mm. l., three outer broader and shorter than the rest. Petals 5, blue, rarely white, puberulous on the inside and sometimes on both sides at the apex, 12 mm. l. Stamens 10, 7-9 mm. l.; anthers recurved after shedding pollen. Fruit usually of 2 carpels, 1.5-2 cm. l. and br., yellow, compressed,

somewhat obcordate, with the base of the style persisting as a small point. Seed solitary in each cell, ellipsoidal, 12 mm. l., 8 mm. br.; seed-coat

thick; embryo in the centre of the thick horny endosperm.

The wood is very fine, close, and even in grain; it is durable and tough, splitting with very great difficulty. It is excessively hard, equalling ebony in this respect. It is used for wheels and cogs for mills, pulley-blocks, pestles, rulers, policemen's batons, balls for bowls, &c. Weight

72 to 83 lbs. per cubic foot. Guaiacum resin is obtained from the wood; "it is a useful remedy in chronic forms of rheumatism, in syphilitic and gouty affections, scrofula, skin diseases, &c." The wood possesses similar properties, but the action is milder, and it is only now used as an ingredient of the official compound decoction of Sarsaparilla (Bentley and Trimen).

2. TRIBULUS L.

Herbs with procumbent branches. Leaves abruptly pinnate, opposite, one of each pair alternately smaller than the other or sometimes wanting; stipules obliquely lanceolate. Flowers

solitary on axillary peduncles. Sepals lanceolate to ovate, soom falling. Petals obovate, deciduous. Stamens 10 in 2 series, the 5 opposite the petals exterior and usually a little longer, the 5 alternate with a small gland at the base outside. Ovary 5-lobed, 5-celled; each cell divided by transverse partitions into 3-5 compartments; ovules one in each compartment attached at the central angle. Fruit 5-coccous; cocci few-seeded, with 3-5 transverse compartments, at length separating, leaving no central axis, not splitting open. Embryo without endosperm.

Species 12, natives of tropical and subtropical regions of the

whole world, including south Europe.

capacity of the pades.

especially at the nodes. Leaves varying in size, 2.5-6 cm. l., with 3-9 pairs of leaflets; leaflets somewhat unequal in size, the larger in the middle of the leaf, 7-17 mm. 1., 3-6 mm. br., unequal-sided, oblong, with silky adpressed hairs beneath. Stipules 4-9 mm. 1. Flowers solitary; peduncle in the axil of the shorter leaf, and longer than it. Sepals 7-9 mm. 1. Petals obovate-cuneate, yellow, with numerous veins straight below, branching above, generally 2-2.5 cm. 1., up to 1.5 cm. br. near apex, sometimes smaller. Stamens 4-8 mm. 1. Ovary hispid with white hairs. Fruit 6-9 mm. 1.; cocci tranversely 5-celled or by abortion 2-4-celled, with 2 horizontally spreading spines above, 4-5 mm. 1., and 2 shorter at the base.

Browne says: "This plant, whether a native, or originally introduced to Jamaica, is now very common about Kingston. The fowls are observed to feed much on the blossoms of this plant, which is thought to heighten

the flavour, as well as to contribute to the fattening of them."

3. KALLSTROEMIA Scop.

Herbs, very similar in habit to species of *Tribulus*; branches ascending or procumbent. Leaves abruptly pinnate, opposite, one of each pair alternately somewhat smaller than the other, or wanting; stipules linear-acuminate. Sepals persistent in the fruit. Petals obovate. Stamens 10, those opposite the petals more or less adhering to their base, the alternate stamens smaller, with a stalked gland at the base outside. Ovary 10-12-lobed, 10-12-celled; ovules one in each cell pendulous from the central angle. Fruit composed of 10-12 cocci; cocci tuberculate, 1-celled, 1-seeded, at length separating, leaving a long central axis, not splitting open. Seed without endosperm.

Species about 20, natives of tropical America.

(After A. Gray.)

oblique, more or less glabrescent, the margins often hairy; stipules persistent, 4-5 mm. l. Flowers solitary; peduncle about as long as, or a little longer than, the opposite leaf. Sepals narrowly lanceolate or linear-lanceolate, acuminate, increasing in length in fruit, but shrivelled, 4-6 mm. l. Petals obovate, veiny, 6-8 mm. l. Stamens 3-4 mm. l. Fruit 8-9 mm. l.; cocci 4-5 mm. l., rough with transverse ridges.

FAMILY XLV. RUTACEÆ.

Shrubs or trees, usually glandular-dotted and strongly smelling. Leaves with pellucid dots, without stipules, generally opposite, and compound, digitate or pinnate, with 1, 3, or 5, or more leaflets. Flowers hermaphrodite, polygamous, or diecious; parts usually in 4's or 5's. Sepals and petals imbricate. Stamens as many as, or twice as many as the petals, numerous in Peltostigma. Carpels generally 4 or 5 (8 in Peltostigma), united into a single 4-5-celled ovary, or free at the base and united in styles or stigmas, or altogether free and 1-celled. Ovules generally 2 in each carpel, superposed, ascending, with ventral raphe and superior micropyle, solitary in Glycosmis and Triphasia, numerous in Citrus. Fruit various. Embryo straight or curved. Cotyledons often fleshy. Endosperm present or wanting.

Species 800 or 900, natives of the temperate and warm regions of the whole world; specially numerous in S. Africa and

Australia.

Calyx, 2 sepals larger.					. Ravenia.	
Calyx regular, or with 1 sepal larger (Peltostigma). Petals						
not united. Ovary 2-5-lobed.						

Fruit baccate.

Floral parts in 4's. Ovary 1-celled 5. Amyris. Floral parts in 5's. Ovary 3-celled 6. Spathelia.

1. RAVENIA Vell.

Shrubs or trees. Leaves opposite, 3-foliolate or simple. Peduncles axillary, few-flowered. Sepals 4 or 5, 2 outer larger, enclosing the bud. Corolla: tube straight, limb oblique with 4 or 5 somewhat unequal segments. Disk cup-shaped, crenate, 4-5-lobed, enclosing the ovary. Stamens 4 or 2; filaments adherent to the corolla-tube; anthers 2-4 at the corolla-throat, staminodes 3-1, linear, exserted. Ovary of 4-5 carpels, immersed in the disk; style 1, slender; stigma 4-5-lobed; ovules 2 in each cell, superposed. Capsule surrounded by the

persistent calyx, with 5-1 cocci; cocci 2-valved; endocarp hard and brittle. Seeds 1 or 2 in each coccus; endosperm in a thin layer; embryo curved; cotyledons 2-lobed, conduplicate, enclosing a long radicle.

Species 5 or 6, natives of West Indies and tropical

S. America.

Leaves 3-foliolate 1. R. spectabilis.

1. R. spectabilis Planch. ex Griseb. Mem. Amer. Acad. n.s. viii. 170 (1860) & Fl. Br. W. Ind. 710; leaves 3-foliolate.— Engl. in Fl. Bras. xii. pt. 2, 126; Urb. in Jahrb. Bot. Gart. Berl.

March! cult. Hope Gardens, Harris!—Cuba, Hispaniola, Guadeloupe. Shrub. Leaves digitately 3-foliolate, glabrous, glandular-dotted, dots more or less pellucid; leaflets narrowly elliptical to oblong, 3-5 cm. l.; petiole 1-2 cm. l. Peduncle 1-3-flowered, 2-6 cm. l. Flowers markedly proternal rous. Sepals 5, glandular-dotted, 2 outer ovate, obtuse, 1·1-1·3 cm. l., 7-10 mm. br., 3 inner much shorter, roundish, adpressed to the tube of the corolla. Corolla purplish-red or pinkish, glandular-dotted, fleshy; tube 1·3 cm. l.; lobes somewhat unequal, the upper being the shorter. Stamens glandular-dotted, 3 lower linear, sterile, the middle one 3-lobed, the 2 lateral and each branch ending in a gland. Seeds ellipsoidal, muriculate, about 3.5 mm. l.

2. R. Swartziana Fawc. & Rendle in Journ. Bot. lv. 38 (1917); leaves simple.—Pomphidea Swartziana Miers Apocyn. S. Amer. 19, t. 1. D (1878); Urb. Symb. Ant. vi. 96. Type in Herb. Mus. Brit.

Jamaica (without locality), Swartz!

Leaves glabrous, glandular-dotted, elliptical, shortly acuminate, 4-8.5 cm. 1.; petiole 2-3 mm. 1. Peduncle to 1 cm. 1., about 2-flowered; pedicels 2-3 mm. 1. Sepals glandular-dotted, puberulous; 2 outer ovate, 6-7 mm. l., 2-3 mm. br., inner lanceolate, about half as long. Corolla glandular-dotted, fleshy; tube 7 mm. l., lobes somewhat unequal, about 5 mm. l. Stamens glandular-dotted, 1 or 2 sterile.

The examination of Swartz's specimen on which Miers founded the genus *Pomphidea*, of which it is the only representative, shows con-

clusively that it is a species of Ravenia.

2. ZANTHOXYLUM L.

Shrubs or trees. Leaves alternate, pinnate with or without an odd leaflet. Inflorescence cymose, usually paniculate. Flowers polygamous or diocious. Calyx 3–5-cleft. Petals 3–5, imbricate or valvate. Male flower: Stamens 3-5, hypogynous. Female flower: Stamens none or scale-like. Carpels 1-5, 1-celled; styles sublateral; ovules 2 in each cell, collateral. Carpels separating in the fruit, opening by the ventral suture, each with one pendulous black seed. Endocarp loose or adherent. Embryo straight or curved, in the axis of fleshy endosperm, with round flat foliaceous cotyledons, and a very short radicle.

Species, about 140, natives of the tropics and warm regions of the whole world.

§ 1. Petiole and rhachis of leaves not winged. Leaflets opposite or alternate; pellucid dots many, all over the leaflet. Inflorescence a terminal panicle. Floral parts in 5's, sometimes in 4's in Z. flavum. Leaflets with many pellucid dots.

Twigs, leaves, inflorescence glabrous......

star-shaped hairs

- 1. Z.elephantiasis.
- 2. Z. martinicense.
- 3. Z. flavum.

§ 2. Petiole and rhachis more or less winged. Leaflets opposite; pellucid dots few, mostly marginal, or Inflorescence mostly lateral, spikelike. Floral parts in 4's. Carpels 2 or 1. Cocci 1 or 2 Leaflets mostly narrowly elliptical, 2.5-5 cm. l.

Leaflets mostly obovate-roundish, 1-2.5 cm. l. Leaflets obovate-oblong or linear-oblong, entire, ·4-1 cm. l., 2-glandular at base.....

4. Z. insulare. 5. Z. Fagara. 6. Z. spinifex.

§ 3. Petiole and rhachis grooved, not winged. Leaflets opposite; pellucid dots numerous. Inflorescence paniculate, terminal and lateral. Floral

§ 4. Petiole and rhachis grooved, not winged. Leaflets opposite; pellucid dots few, mostly marginal, or wanting. Inflorescence mostly paniculate, terminal and in upper axils, corymbose. Floral parts in 3's. Cocci 1-3.

Inflorescence clustered, axillary, shorter than petiole. Ovary of 2 carpels...... 8. Z. trifoliatum. Inflorescence terminal and in upper axils,

corymbose. Ovary of 3 carpels.

Leaves with an odd leaflet.

Apex of leaflets rounded, entire ... 9. Z. Hartii. Apex of leaflets shortly acuminate,

Leaves without, sometimes with, an

odd leaflet.

Apex of leaflets obtuse or rounded, emarginate, or broadly and obtusely acuminate.

Leaflets 7-13 cm. l. 12. Z. negrilense.

Ovary of 1 carpel.

Leaves without an odd leaflet.

Apex of leaflets usually somewhat narrowly acuminate, more or

less emarginate 13. Z. acuminatum.

- § 1. Prickles, if present, straight or slightly incurved, scattered on the branches. Leaves with petiole and rhachis not winged nor grooved; leaflets opposite or alternate; pellucid dots many, all over the leaflet. Inflorescence terminal, paniculate. Floral parts in 5's, or, in Z. flavum, in 5's or 4's. Carpels 5, but $\overline{2}$ (3-1) in Z. flavum.
- 1. Z. elephantiasis Macf. Jam. i. 193 (1837); twigs, leaves, and inflorescence glabrous; leaflets coarsely crenate, with many scattered and marginal pellucid dots; floral parts in 5's; carpels 5; cocci 5-1, separate, stalked.—P. Wils. in N. Amer. Fl. xxv. 193. Z. aromaticum DC. Prodr. i. 727 (1824) (excl. syn. Jacq.); Griseb. Fl. Br. W. Ind. 138 (as regards plants from Jamaica and

Haiti) (non Willd.). Fagara elephantiasis Kr. & Urb. in Engl. Jahrb, xxi, 564 (1896).

Jamaican Satin Wood, Yellow Sanders.

March! Sheaver! Pedro, Grabham! Lacovia, Tomlinson! Milk River, Nixon! Southfield, 1500 ft., Port Henderson; Harris! Fl. Jam. 6466, 7068, 10,150.—Bermuda, Florida Keys, Bahamas, Hispaniola, Porto Rico, St. John, Montserrat, Guadeloupe, Marie-Galante, Martinique, St. Lucia.

Shrub or tree, without spines or prickles, 10-35 ft. high; trunk 10-20 inches in diam. Leaves 1-3 dm. l., crowded at the ends of twigs, generally with an odd leaflet; petiole '5-1 dm. 1.; leaflets in 3-5 (1) pairs, opposite, subsessile, ovate to lanceolate or elliptical-oblong, generally acuminate, base rounded or obtuse, unequal-sided, 5-12 cm. l., margin slightly recurved. Pedicels 1-4 mm. l. Sepals open in bud, triangular, papery,

recurved. Pedicels 1-4 mm. 1. Sepais open in bud, triangular, papery, puberulous-ciliate, about '5 mm. 1. Petals greenish-white, glandular, 3-4 mm. 1. Fruit: cocci obovate-roundish, 4-6 mm. 1.

In hardness and grain the wood is like boxwood; it is of a yellowish colour and satiny lustre with a rippled pattern in longitudinal section, and is capable of taking a beautiful polish. It is used for turnery, for brush-backs, cabinet work, furniture, etc. Weight about 56 lbs. per cubic

foot of the dry wood.

- § 2. Prickles, if present, straight or slightly recurved, generally stipular on the branches. Leaves with petiole and rhachis more or less winged; leaflets opposite; pellucid dots few, mostly marginal, or wanting. Inflorescences of simple or branched spike-like racemes, or of flowers solitary or clustered; pedicels, if present, thickened. Floral parts in 4's. Carpels 2, or usually 1 in Z. insulare. Fruit of 1 or 2 nutlets.
- 4. Z. insulare Rose N. Amer. Fauna xiv. 79 (1899); leaflets crenate, narrowly elliptical or elliptical, lanceolate, obovate to oblanceolate, 2.5-5 cm. l.; inflorescences several, lateral and terminal; carpels 1, or occasionally 2 in terminal flowers; coccus 1.—P. Colombia, Peru, Tres Marias and Socorro Is.

We have not seen Rose's specimen from Maria Madre Is., but according to P. Wilson it is specifically the same as the Jamaican plant, and the species, he says, is found also in Socorro Is. and in northern and

western S. America.

Tree, 20-30 ft. high, with corky conical knobs occurring sparingly at base of trunk and on the lower limbs, very rarely with prickles on the branches. Leaves 7-10 cm. l.; leaflets 7-15, unequal-sided, apex obtuse, sometimes emarginate, base usually acute, turning blackish in drying, generally glandular-dotted, sessile or subsessile. Inflorescence 4-10 cm. l.,

glabrous; bracts ·5-1 mm. l., ciliolulate. Sepals 4, of male flower about 1 mm, l., slightly imbricate at the base; of female flowers imbricate, shorter, roundish, the outer broader than long. Petals 4, of male flowers about 3 mm. 1., oblong-elliptical; of female flowers about 2 mm. 1., elliptical. Stamens 4, in male flower slightly longer than the petals, wanting in female flowers or staminodes developed. Pistil of male flower rather shorter than the petals, sterile. Coccus 5-7 mm. l., subglobular, outer surface wrinkled, with or without brown glandular dots; endocarp at length free, and dropping out with the seed. Seed 3-4 mm. in diam., subglobular.

5. Z. Fagara Sarq. in Gard. & Forest iii. 186 (1890) & Silv. i. 73, t. 32; leaflets obovate to roundish or sometimes elliptical, margin slightly wavy, 1-2.5(-3.5) cm. l.; inflorescence in spikelike racemes, solitary or 2-3 in the axils, or sometimes forming a sort of head; carpels 2; cocci 1 or 2.—P. Wils. tom. cit. 190. Z. Pterota H. B. & K. Nov. Gen. & Sp. vi. 3 (1823); DC. Prodr. i. 725; Nutt. Sylv. iii. 11, t. 84. Lauro affinis Jasmini &c. Sloane Cat. 137 & Hist. ii. 25, t. 162, f. 1. Shrub or tree, 6-30 ft. high; trees more or less armed, trunk with corky conical knobs with an apical spine, branches sometimes with slightly recurved prickles in the place of stipules. Leaves 4-8 cm. l., with the rhachis and usually also the petiole narrowly winged; leaflets 7-9(-11), somewhat equal-sided or occasionally unequal-sided, apex rounded, genesomewnat equal-sided or occasionally unequal-sided, apex rounded, generally emarginate. pellucid dots absent except sometimes a few marginal. Inflorescence '7-2 cm. 1.; bracts persistent, about '5 mm. 1. Flowers: male and female on separate plants. Sepals slightly imbricate at base in bud, of male flower somewhat square with a triangular apex, about 1 mm. 1., of female about '7 mm. 1. Petals of male flower about 3 mm. 1., oblong or oblong-obovate. Stamens longer than the petals. Pistil in male flowers about half as long as petals, sterile; in female flowers on a gynophore branching above into the stalks of the two carpels. Cocci about 3 mm. 1. subglobular with minute glandular dots; endocare of about 3 mm. l., subglobular, with minute glandular dots; endocarp at length free. Seed 2:5-3 mm. l. and thick.

The heartwood is brown tinged with red, with a thin yellowish sapwood. The wood is hard and very close-grained. Weight about 46 lbs. per cubic

foot of the dry wood.

6. Z. spinifex DC. Prodr. i. 728 (1824); leaflets entire, obovate to linear-oblong, base with 2 glands beneath, '4-1 cm. l., · 2-·5 cm. br.; inflorescence sessile, axillary, consisting of one flower or a cluster of a few flowers; carpels 2; nutlets 1 or 2.— P. Wils. tom. cit. 187. Fagara spinifex Jacq. Fragm. 10, t. 6, f. 2 (1809); Urb. in tom. cit. 577 & Symb. Ant. iv. 318. F. microphylla Desf. Tabl. i. 200 (1804) (name only); Ham. Rosewood, Cæsar-wood.

Tyre, near Troy, 2000 ft.; Fray woods, 1600 to 1800 ft.; Peckham, Clarendon, 2500 to 2800 ft.; Harris! Fl. Jam. 9992, 10,347, 10,866,

11,044.

Tree 25-50 ft. high; trunk up to 2 ft. in diam. Leaves equally pinnate; rhachis and petiole, 3-6(-8) cm. 1.; leaflets in 1-2(-3) pairs, obovate to oblanceolate, or elliptical-oblong, sessile, apex obtuse to rounded, sometimes truncate or emarginate below, tapering gradually to the base, generally equal-sided, shining above, nerves with veins joining them prominent on both sides, 4-7 cm. 1., 3·5-1·5 cm. br.; margin entire; surface on both sides but especially beneath, marked with very numerous glandular dots more or less pellucid. Panicles 3-5 cm. 1. Male flowers: Sepals 4, free, shortly triangular, open in bud, 5 mm. 1. Petals 4, narrowly imbricate, ovate, 2-2·5 mm. 1., glandular. Filaments 4, to 1·5 mm. 1.; anthers heart-shaped. Ovary very rudimentary. Female flowers not known. Coccus globular, wrinkled, not keeled, 5-6 mm. 1.; endocarp not becoming loose. endocarp not becoming loose.

- § 4. Prickles, if present, straight, generally scattered on the branches, stipular in Z. trifoliatum. Leaves with petiole and rhachis grooved, not winged; with or without an odd leaflet; leaflets opposite; pellucid dots few, mostly marginal, or wanting. Inflorescence paniculate, sometimes corymbose, terminal and in upper axils; pedicels, if present, slender. Floral parts in 3's. Carpels 3, 2, or 1. Fruit of 1-3 cocci.
- 8. Z. trifoliatum Wright Mem. 240 (1828) (non L.); leaves with an odd leaflet; leaflets usually 3, obovate-elliptical to elliptical-lanceolate, apex retuse or emarginate, rounded, obtuse, acute, or shortly acuminate; inflorescence axillary, clustered, racemose or paniculate, shorter than the petiole; carpels 2; cocci 2 (or 1).—Z. punctatum Vahl in West Bidr. Ste. Croix 310 (1793); P. Wils. in N. Amer. Fl. xxv. 182. Z. ternatum Sw. Fl. Ind. Occ. 570 (1797). Fagara trifoliata Sw. Prodr. 33 (1788); Urb. in Engl. Jahrb. xxi. 584. Tobinia ternata Ham. Prodr. 57 (1825); Griseb. op. cit. 136. T. punctata Griseb. op. cit. 137 (1859). The type, F. trifoliata Sw., is in Herb. Mus. Brit.

Toothache Tree.

Wright; Bertero.-West Indies (but not recorded from Cuba).

Shrub 6-25 ft. high. Branches: sterile, usually with stipular prickles, flowering, generally without prickles. Leaflets 3 (2-7), even 13 in young plants, 2·5-8 cm. l., 1·2-4 cm. br.; margin altogether or towards the apex obscurely crenulate, with black glandular dots beneath, rarely with a few pellucid dots. Inflorescence to 1·5 cm. l. Flowers shortly stalked. Sepals 3, ·4-7 mm. l. Petals 3, 1·8-2·3 mm. l., white or yellowishwhite, roundish-ovate or elliptical. Cocci globular, 3·5-4 mm. l., 3-3·5 mm. br.

Wright states that the root-bark of this species and of Z. martinicense

DC. produces salivary discharge, and is serviceable in toothache.

Z. trifoliatum L. (Sp. Pl. 270), of which there is a specimen in Herb. Linn., is Acanthopanax aculeatum Seem.

9. Z. Hartii P. Wils. in Bull. Torr. Bot. Club xxxvii. 85 (1910) & in N. Amer. Fl xxv. pt. 3, 185; leaves with an odd leaflet; leaflets elliptical, apex obtuse or rounded; inflorescence terminal and axillary, corymbose; carpels 3.—Fagara Hartii Kr. & Urb. in Engl. Jahrb. xxi. 556 (1896).

J.P. 1480, Hart; below John Crow Peak, 5800 ft., Harris! Fl. Jam.

6524 (Harris's specimen without either flowers or fruit).

Tree, 18 ft. high; trunk divided into several stems just above the ground; small stems armed with spines, branches unarmed. Leaves 2-6 cm. l.; leatlets 3-9, sometimes slightly unequal-sided, but base more so, 2-5 cm. l., margin crenulate, glandular-dotted beneath; pellucid dots along the margin, rarely within. Inflorescence (not seen by us) 1·5-2 cm. l.; bracts ovate to roundish-triangular, 1·5-·5 mm. l. Female flowers not quite fully developed. Sepals 3, about 1 mm. l. Petals 3, elliptical, with rounded apex. Staminodes wanting. Gynophore short, disk-like. Ovary of 3 sessile carpels, slightly united above the base.

10. Z. jamaicense P. Wils. in Torreya ix. 32 (1909) & in N. Amer. Fl. xxv. pt. 3, 185; leaves with an odd leaflet; leaflets elliptical to oblong-elliptical, apex usually shortly and abruptly acuminate, rarely rounded, emarginate; panicles terminal, corymbose: carpels 3: cocci 2 or 1 with 1 or 2 aborted.

Dolphin Head, Britton, 2310! hills near Kempshot, Britton, 2433.

Tree 15-30 ft. high, trunk with corky spiny knobs at the base, branches unarmed or with a few slender straight prickles. Leaves 12-20 cm. l., sometimes, with the rhachis and midrib of leaflet beneath, prickly; leaflets in 1-4 pairs, sessile or subsessile (but terminal long-stalked), 9-3 cm. l., margin slightly crenulate or entire, nerves and veins reticulate, prominulous beneath, less so above, pellucid dots along the margin and very few within. Male flowers (immature): Sepals 3. Petals 3, ovate. Stamens 3. Female flowers: Sepals 3, semicircular or broadly triangular. Petals 3, ovate, 2-2·2 mm. 1. Carpels distinct. Cocci globular, apiculate, surface pitted, 4 mm. in diam.

We have only seen a poor specimen, and have had to depend for the

most part on P. Wilson's description.

11. Z. spinosum Sw. Fl. Ind. Occ. 574 (1797); leaves with or without an odd leaflet; leaflets 1.5-6 cm. 1., roundishelliptical, elliptical, or oblong-elliptical to ovate, apex rounded or obtuse, slightly emarginate, or broadly and obtusely acuminate; panicles terminal and axillary, corymbose; carpels 2-3; cocci 1-3.—DC. Prodr. i. 726; Macf. Jam. i. 192; P. Wils. in N. Amer. Fl. xxv. 186. Z. emarginatum Sw. Fl. Ind. Occ. 572 (1797); DC. Prodr. i. 726; Macf. Jam. i. 190. Z. sapindoides DC. Prodr. i. 728 (1824); Macf. Brit.

Lignum Rorum, Licca Tree, Suarra Wood.

Sloane Herb. v. 83! Wright! Shakspear! below Berwick House; Flamstead; Macfadyen; high woods, St. Ann, Purdie! Wilson! March! Ferry Pen, 150 ft., Campbell! Tweedside road, south St. Andrew, 2000 ft.; Content road, 2000 ft.; near Lititz, 500 ft.; Long Mt. south side, 500–800 ft.; Pedro Bluff; near Ferry, 200 ft.; Llandovery; Inverness, Clarendon, 200 ft.; Harris! Fl. Jam. 5665, 5666, 6281, 6290, 7220, 8934, 9575, 9728, 10,044, 10,375, 11,689.

Shrub 4-10 ft. high, or tree to 20 ft. high, spiny or unarmed; trunk armed with broad conical spiny knobs, or unarmed; twigs thickly covered with long straight spines or unarmed. Leaves 7-15 cm. l., with a pair of spines below the insertion of the leaflets on the upper side with a few other spines beneath, or unarmed; leaflets in 2-6(-10) pairs, sessile or subsessile, base rounded or obtuse, often unequal-sided, shiny on upper

surface, paler beneath, 1.5-6.5 cm. l., with or without spines on midrib beneath, nerves and veins reticulate, more or less prominent on both sides, margin entire or slightly crenulate, sometimes with pellucid dots along the margin, especially one at the apex, occasionally with glandular dots the margin, especially one at the apex, occasionally with glandular dots on one or both sides. Peduncle 3-6 cm. l.; pedicels to 2 mm. l. in flowers, to 4 mm. l. in fruit. Bracts triangular, ·5 mm. l. Flowers white, fragrant. Male flowers: Sepals 3, open in bud, united at base, roundish-deltoid, ·5-·7 mm. l. Petals 3, elliptical, imbricate, 2·5-3 mm. l. Stamens 3, slightly longer than the petals. Pistil sterile, of 2 carpels, united but styles distinct, or rudimentary. Female flowers: Staminodes wanting. Pistil about as long as the petals, carpels more or less united; stigma one, peltate; styles about half the length of the ovaries. Cocci sessile roundishslightly united at the base, with 1 or 2 abortive cocci, sessile, roundishellipsoidal, slightly apiculate, glandular-dotted or dots obsolete, 5-6 mm. l.; seeds 4.5-5.5 mm. l.

Sloane states that the wood is very fragrant when burning. Small

stems are cut for use as walking sticks and umbrella sticks.

We think that all the various forms included here may be considered as one very variable species. Urban divides them into three species: F. sapindoides, leaves without an odd leaflet; leaflets 8, on both sides minutely dotted; inflorescence axillary shorter than the leaves; F. Swartzii, leaves with or without an odd leaflet; leaflets 12-20, 2.5-4 cm.l., sparingly dotted on the lower surface, with pellucid dots on the margin; inflorescence terminal; F. spinosa, leaves without an odd leaflet; leaflets 4-10, 3.5-6.5 cm. l., not dotted, with pellucid dots on the margin; inflorescence terminal.

12. Z. negrilense Fawc. & Rendle in Journ. Bot. lv. 271 (1917); leaves without an odd leaflet; leaflets 7-13 cm. l., elliptical to oblong, apex obtuse, slightly emarginate, sometimes very shortly and abruptly acuminate, base unequal-sided, more or less rounded, pellucid dots wanting; panicles terminal, corymbose; carpels 3; cocci 1 or 2. Type in Herb. Jam.

In rocky woodland, near lighthouse, Negril, 300 ft., Harris! Fl. Jam.

10,242.

Small tree, 10 ft. high, without spines or prickles. Leaves 1.5-3 dm. l.; leaflets in 2-4 pairs, shining above, nerves and veins prominulous on both sides, reticulate; margin entire; petiole and rhachis with a shallow groove above. Inflorescence about 8 cm. l. Cocci ellipsoidal, rough with wrinkles and glandular dots, keeled along one side where the valves split open, about 5 mm. l.; endocarp persisting, while the exocarp and seeds drop away; abortive carpids 1 mm. l.

13. Z. acuminatum Sw. Fl. Ind. Occ. 575 (1797); leaves without an odd leaflet; leaflets elliptical to oblong-lanceolate, generally somewhat narrowly acuminate, apex blunt and generally more or less emarginate; panicles terminal and axillary, corymbose; carpel 1; coccus 1.—DC. Prodr. i. 726; Macf. Jam. i. 192; P. Wils. tom. cit. 183. Fagara acuminata Sw. Prodr. 33 (1788); Kr. & Urb. in Engl. Jahrb. xxi. 593. Tobinia acuminata Ham. Prodr. 57 (1825). T. coriacea Griseb. loc. cit. (1859) (non Desv.). Type in Herb. Mus. Brit.

Wright! Dr. Lindsay! Tweedside, Macfadyen! March! J.P. 2087, Morris! Green Valley, 2500 ft.; Westphalia road, 3000 ft.; Grandvale, Westmoreland, 500 ft.; Stanmore Hill, 2200 ft.; Harris! Fl. Jam. 5209 b.

5315, 6129, 6549, 6550, 7100, 9874.

Shrub or tree, 15-40 ft. high; trunk and sometimes the larger branches armed with somewhat flattened conical corky spines; twigs and leaves generally without spines. Leaves 3-18 cm. l.; leaflets in 2-4 pairs, base wedge-shaped, shining above, nerves and veins prominulous on both sides, reticulate, 5-13 cm. l.; margin entire or obscurely crenulate; pellucid dots along the margin. Inflorescence 5-10 cm. l. Male flowers: Sepals 3, united below, open in bud, roundish-ovate, about 5 mm. l. Petals 3, broadly elliptical, very imbricate, concave, 2.3 mm. l. Stamens 3, a little longer than the petals. Pistil rudimentary, about 1 mm. l., 3-lobed at Female flowers: Petals 3, roundish-obovate. base, acuminate above. hooded, 2.5 mm. l. Staminodes none. Gynophore disk-like, about onethird as long as the ovary. Carpel with 2 ovules; style lateral. Coccus globular, slightly apiculate, rough with wrinkles and glandular dots, keeled along one side where the valves split open, 5 mm. l.; endocarp at length loose.

3. PELTOSTIGMA Walp.

A small tree. Leaves alternate, digitate, with 3 leaflets. Flowers large, sweet-scented, in a long-stalked few-flowered axillary corymb; pedicels with leafy deciduous bracts. Sepals 4(3),

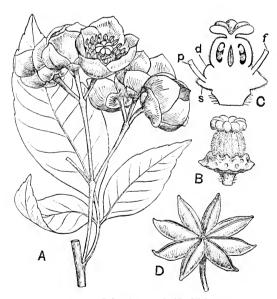

Fig. 57.—Peltostigma pteleoides Walp.

filament (f), ovary with ovules, and stigma, much enlarged.

D, Fruit showing the cocci opening above

deciduous, the inner petal-like, the 2 outer smaller, herbaceous. Petals 4. Disk thick, fleshy. Stamens numerous, unequal, inserted on the disk. Pistil consisting of 8 (6–10) one-celled carpels, united at the sides and free at the axis; stigma large, 8-lobed, subsessile. Ovules 2 in each cell, superposed or collateral. Cocci 8 (6–10), each with 2 (1) seeds.

Species 1, a native of Jamaica only.

P. pteleoides Walp. Rep. v. 387 (1845-46); Griseb. Fl. Br. W. Ind. 136; Baill. Hist. iv. 393, f. 443, 444; Engl. in Engl.-Prantl Pflzfam. iii. pt. 4, f. 69, N-R; Urb. in Engl. Jahrb. xxi. 554; P. Wils. in N. Amer. Fl. xxv. 206. Pachystigma pteleoides Hook. Ic. Pl. t. 698, 699 (1844); Bot. May. t. 4436. (Fig. 57.)

Candle Wood.

St. Cruz Mts., Purdie! Potsdam woodland, St. Cruz Mts., 2600 ft., Harris! Fl. Jam. 9800; also Britton, 1272! cult. in Hope Gardens, Harris! Tree to 25 ft. high, with a balsamic odour. Leaflets 3 (sometimes 5), elliptical to lanceolate or oblanceolate, entire or obsoletely serrate above, apex acute or shortly acuminate, tapering to base and decurrent into the petiolule, with very numerous pellucid dots, the terminal leaflet larger, 4–12 cm. l. Pedicels 1–2 cm. l., bracteolate at base; bracts and bractcoles deciduous, foliaceous, bracts about 1·5 cm. l., bracteoles about half as long. Flowers cream-coloured, fragrant. Sepals deciduous, 6–10 mm. l. Petals roundish-elliptical, concave, about 1·5 cm. l. Stamens 5–8 mm. l.

4. ESENBECKIA H. B. & K.

Pistil 5-6 mm. l. Cocci about 2 cm. l., about 1 cm. br.

Trees or shrubs. Leaves alternate, digitate, 5(-3)-foliolate in *E. pentaphylla*; leaflets entire, with numerous pellucid dots. Panicles axillary and terminal. Calyx 4–5-lobed, or 4 or 5 sepals, imbricate. Petals 4–5, imbricate or valvate. Stamens 4–5, inserted at the base of the disk between the lobes. Ovary deeply 4–5-lobed, 4–5-celled; style basal; ovules 2 in each cell, collateral, affixed near the base of the interior angle. Capsule subglobose, muricate, echinate, or coarsely wrinkled, septicidally 5-carpellate; cocci loculicidally 2-valved, 1-seeded. Seeds without endosperm; cotyledons unequal, sometimes in a whorl of 3.

Species about 20, natives of tropical America (incl. the West

Indies).

E. pentaphylla Griseb. Fl. Br. W. Ind. 135 (1859); Urb. in Engl. Jahrb. xxi. 553; P. Wils. in N. Amer. Fl. xxv. 201. Galipea pentaphylla Macf. Jam. i. 196 (1837). (Fig. 58.)

Citron.

Cultivated; Sloane Herb. vii. 112! native of China, and possibly also of India.

Shrub or tree, 8–10 ft. high; trunk short, indistinct; branches armed with stout horizontal spines (often long), or sometimes unarmed. Flowers solitary or usually in short racemes of 3–10 flowers, the buds purplish. Calyx 3-4 mm. 1., shallow, with 5 teeth. Petals 5, oblong, incurved at the tip, white within, usually tinged with purplish-pink outside, nearly 2 cm. 1. Stamens about 40, irregular in length, nearly as long as the petals, usually united below into bundles of about 4 in each. Ovary 9-12-celled. Fruit more or less oblong in outline, often 2 dm. 1., apex usually blunt (rarely nipple-shaped), style often persistent; surface rugged with both transverse and longitudinal furrows, or smooth and even; rind 3–7 cm. thick, a thin

outer layer full of vesicles of essential oil, and the white thick inner substance. Seeds ellipsoidal, plump, light-coloured, smooth.

The shrub is very sensitive to cold. The rind of the fruit is preserved.

2. C. Limonum Risso in Ann. Mus. Paris xx. 201 (1813); leaflet ovate-elliptical or oblong-elliptical, tapering to the apex, 5-14 cm. l., apex acute, margin serrulate; petiole with or without a linear margin or narrow oblanceolate wing, distinctly jointed with the leaflet; fruit oblong-ellipsoidal, sometimes somewhat obovoid, 6-10 cm. l., usually with a nipple-shaped apex, rind thin, pale yellow, pulp abundant, very juicy, acid, pale yellow.— Risso Orang. t. 70, 84; Wright Mem. 201; Macf. in Hook. Bot. Misc. i. 279 & Jam. i. 126; Berg & Schmidt Off. Gew. iv. t. 31, f.; Bentl. & Trim. Med. Pl. t. 54; Hume Citrus t. 11 & f. 30; P. Wils. loc. cit. C. medica var. Limon L. Sp. Pl. 782 (1753). C. Lemon.

Cultivated; native of India and China.

Shrub or tree, 10-20 ft. high; branches armed with spines in the leaf-axils. Flowers solitary, rarely 2 or 3 together, axillary; buds purplish. Calyx about 3 mm. 1., shallow, with 4-5 spreading teeth, persistent. Petals 5, oblong, strongly reflexed, white within, tinged with purplish-pink outside, nearly 2 cm. 1. Stamens 20-30(-35), nearly as long as the petals, usually united below into bundles of about 4. Ovary 7-10-celled. Fruit smooth, sometimes wrinkled, pitted over the oil-glands; colour light yellow. Seeds oval, pointed at one (micropylar) end, quite smooth.

3. C. aurantifolia Swingle in Journ. Wash. Acad. Sc. iii. 463 (1913); leaflet ovate-elliptical or ovate-lanceolate, 6-9 cm. l., crenulate, apex usually obtuse; petiole usually with a narrow oblanceolate wing; fruit subglobular or ellipsoidal, very fragrant, 3.5-6.5 cm. l., often with a nipple-shaped apex, rind very thin, smooth, pale yellow or greenish, pulp abundant, agreeably acid, greenish.—C. lima Lun. loc. cit.; Macf. in Hook. Bot. Misc. i. 300 & Jam. i. 127; P. Wils. loc. cit. C. medica L. Sp. Pl. 782 (1753) (in part); Descourt. Fl. Ant. i. t. 7; Wright Mem. 201. C. limetta Wight Ic. t. 958 (non Risso). Limonia aurantifolia Christmann in Linn. Pflanzensystem i. 618 (1777).

Lime.

Cultivated and spontaneous; probably native of India. Shrub or tree to 15 or 20 ft. high; branches armed with spines in the leaf-axils. Flowers axillary, solitary, or 2-10 in clusters or short racemes. Calyx with 4-5 acute teeth, about 4 mm. l. Petals 4-5, oblong-lanceolate, white or pale pink, 1-1.5 cm. l. Stamens about 25, united in a number of groups. Ovary 9-10-celled. Fruit, juice-cells small, slender, pointed. Secds small, ellipsoidal, pointed.

This species forms a good fence when well pruned. The fruit is picked and used green before it is ripe. The juice is considered to be purer and superior to that of the lemon, and is looked upon as an indispensable addition to many dishes, and is also used in the laundry; it is the chief source of citric acid, so important in the dyeing industry, and is of considerable value from a medicinal point of view. The young fruits, or the rind only of older fruits, are preserved in sugar and are eaten as a sweet-

meat to aid digestion.

Bonavia (Oranges &c. 80-89) considers that the "lima" of Cevlon, with large petiolar wings and warty thick-skinned fruit, is the wild form of the This "lima" is the Limo ventricosus (Lemon Purrut) of Rumf (Amboin. ii. 102, t. 26, f. 1, probably f. 3 is only a smooth form of the same). The following forms given by Rumf, viz. L. agrestis (Lemon Papeda) ii. 104, t. 27, L. ferus (Lemon Swangi) ii. 106, t. 28, L. aurarius (Lemon Maas) ii. 109, t. 30, seem to be only forms of *L. ventricosus*; while in his *Limonellus* or *Limo tenuis* (Lemon Nipis) ii. 107, t. 29, we have the form selected for cultivation, the "lime," with small petiolar wings and smooth pleasantly acid fruit. Even if this view be not accepted, Christmann certainly includes the common lime in his name Limonia aurantifolia.

4. C. Aurantium L. Sp. Pl. 782 (1753) (in part); leaflet oblong-elliptical, with a faint characteristic scent, 7-14 cm. l., apex acute or somewhat acuminate, sometimes obtuse, margin entire or slightly crenulate-serrate; petiole usually with a narrow oblanceolate wing; fruit globular or somewhat flattened at top and bottom, 6-9 cm. in diam., usually with solid core, rind closely fitting, usually thin, smooth or slightly rough, pulp abundant, sweet and subacid, yellow or red (in blood-orange).—Risso in Ann. Mus. Par. xx. 181 & Orang. t. 3-29; Tussac Fl. Ant. iii. t. 14; Griseb. loc. cit. (in part); Hook. f. loc. cit. (excl. vars.); Bentl. & Trim. Med. Pl. t. 51; Hume Citrus t. 4 & f. 15; P. Wils. tom. cit. 223; Bonavia op. cit. 19, t. 40-58. C. sinensis Osbeck Dagbok Ostind. Resa 41 (1757) (name only) & Reise Ostind. China 250 (1765), fide Swingle op. cit. 148. C. Aurantium var. duleis Wright Mem. 203; Macf. in Hook. Bot. Misc. i. 301 & Jam. i. 128. Malus Aurantia sinensis Sloane Cat. 211 & Hist. ii. 181. C. fructu sphærico...dulci &c. Browne Hist. Jam. 309. Aurantium sinense Miller Gard. Dict. ed. 8 (1768). Leaves of both C. Aurantium L. & C. vulgaris Risso are included on the same sheet in Herb. Linn. and named Aurantium by Linnaus.

Cultivated and spontaneous; native of China and Cochin-china.

Tree 20-30 ft. high; branches generally armed with short spines in the leaf-axils. Peduncles solitary, axillary, 1-6-flowered, generally shorter than the petiole. Flowers very fragrant, white. Calyx 3-4 mm. 1., with 3-5 short broad acute teeth, persistent. Petals 5 (or 4), oblong, 1.2-2.2 cm. l., dotted with green on the outside, recurved. Stamens 20-25, unequal: filaments flattened, often united at the base in threes or fours, shorter than the petals. Ovary 8-11(-14) celled. Fruit, juice-cells spindle-shaped. Seeds oblong-ovoid, plano-convex, narrowed towards the attachment, with a short oblique beak at the apex, wrinkled more or less.

The Navel Orange with adventitious sections at the apex not

completely covered by the outer rind, and with very few seeds, sometimes appears as a sport on trees in Jamaica (e.g. at Savoy), otherwise bearing

ordinary oranges.

5. C. vulgaris Risso in Ann. Mus. Par. xx. 190 (1813): somewhat like C. Aurantium, but petiole broadly winged, leaflets with a strong and characteristic pleasant scent; fruit somewhat rougher, darker in colour, often nearly red, core becoming hollow, rind bitter, pungent, and strongly aromatic, coverings of sections bitter, pulp acid.—Risso Orang. t. 30-52; Berg & Schmidt Off. Gew. iv. t. 31e; Bentl. & Trim. Med. Pl. t. 50; Bonavia Oranges &c. 1, t. 1-18; P. Wils. loc. cit. C. Aurantium L. Sp. Pl. 782 (1753) (in part); Swingle tom. cit. 147. C. bigaradia Loisel. in Duham. Arb. ed. Nov. vii. 99 (1819); Tussac tom. cit. t. 15. C. Aurantium var. amara Wright Mem. 203. C. Aurantium var. vulgaris Macf. loc. cit. C. Aurantium var. bigaradia Griseb. loc. cit.; Hook. f. loc. cit. Malus Aurantia vulgaris major Sloane Cat. 210 & Hist. ii. 179. C. fructu sphærico . . . acido &c. Browne Hist. Jam. 308.

Seville Orange, Bigarade Orange, Bitter Orange. Cultivated and spontaneous; native of China, Cochin-china, Malay Is.,

and possibly India.

Tree, much like C. Aurantium. Spines somewhat longer. Flowers rather larger and more strongly scented. Calyx more regularly 4-5toothed. Petals 5(4), white, linear-oblong, conspicuously dotted with oilcells. Fruit, juice-cells sometimes smaller than those of C. Aurantium. Seeds flattened, marked with ridged lines.

The leaves are preferred to those of the Orange by perfumers for distillation for essential oil. The pulp and rind of the fruit makes the best marmalade. The tree is resistant to foot-rot, and is therefore used as a stock on which to bud the Orange, Lemon, &c.

The Bitters weet or Seville-sweet Orange is a variety, the

flavour of the juice being sweet and pleasantly flavoured.

6. C. nobilis Lour. Fl. Cochin. 466 (1790); leaflet lanceolate to elliptical, 5-10 cm. l., margin slightly crenulate; scent of leaves, fruit, &c. peculiar and characteristic; petiole short, not margined; fruit somewhat globular, or pear-shaped, more or less flattened or depressed at top and bottom, size variable, from smaller than the sweet orange to about the same size, rind more or less loose or baggy and easily removed, smooth or rough, colour orange to reddish, pulp abundant, orange-coloured to reddish, sweet and subacid with peculiar pleasant flavour, sections and their coverings easily separable.—Ait. Hort. Kew. ed. 2, ir. 420; Andrews Bot. Rep. t. 608; Bot. Reg. t. 211; Forbes &

Hemsl. in Journ. Linn. Soc. xxiii. 111; Bonavia Oranges &c. 44-59, t. 92-128; Webber in Bailey's Cyclop. of Amer. Hort. i. 323; Hume in Bull. Florida Exp. St. lxvi. 582, t. 1 (1903) & Citrus 17, t. 2, 5-8; Taylor in Yearb. U.S. Dept. Agr. 1907, 311-313, t. 34; Swingle in. Pl. Wils. pt. 4, 142. C. Aurantium var. sinensis L. Sp. Pl. 783 (1753). C. deliciosa Tenore in Ind. Sem. Hort. Bot. Neapol. [9] (1840), & in Atti R. Istit. Napoli vii. 1, with tab. (1847). C. nobilis var. deliciosa Swingle loc. cit.

King Orange, Tangierine Orange, Mandarin Orange.

Cultivated; native of Cochin-china and China.

Tree 12-20 ft. high; branches with or without spines. Flowers solitary or in clusters of 3 or 4, terminal or axillary, white, sweet-scented, small, 2-2·5 cm. in diam. Petals 8-10 mm. l. Stamens 18-23, shorter than the petals, only slightly united. Ovary 9-15-celled. Fruit, juice-cells broad and blunt. Seeds top-shaped, beaked; cotyledons greenish.

Adventitious sections sometimes occur at the apex, especially in the large form, so well known at Porus, but they are enclosed by the rind, not

exposed as in the Navel Orange.

- C. nobilis is described by Loureyro as a tree without spines, ascending branches, lanceolate leaves, petiole without wings, peduncle terminal, with several flowers, fruit compressed-round, red inside and out, 5 inches in diam., rind thick, sweet, edible, very rough, pulp most pleasant of all citrus fruits, native of Cochin-china. Swingle is of the opinion that the "King Orange" introduced into the United States in 1880 from Saigon, Cochin-china, is this species (see Taylor's plate in Year-book), and that Wilson's specimen of a cultivated plant in China is also the same.
- C. deliciosa is described and figured by Tenore as a tree armed with strong spines $\frac{1}{2}$ -2 inches long, leaves lanceolate, petiole without wings, flowers solitary, axillary, fruit strongly compressed, rind thin, pulp outside and inside of a yellow-orange colour, delicious to the taste. The figure of the fruit is $2\frac{1}{4}$ inches in diameter. Swingle (in Pl. Wils.) provisionally considers this to be a variety of C. nobilis, and to include the cultivated forms known as Tangierine and Mandarin Oranges; he says, however, that "better knowledge of this complex group may resolve it into several closely allied species."
- 7. C. grandis Osbeck Dagbok Ostind. Resa 98 (1757); leaflet elliptical to ovate-oblong, usually puberulous beneath on the midrib, especially when young, 10-20 cm. 1., apex rounded or somewhat acuminate, sometimes emarginate, margin more or less crenulate; petiole broadly winged; fruit very large, globular or pear-shaped, 10-20 cm. 1., light lemon or orange-coloured, rind thick, white, spongy, bitter, usually smooth, coverings of sections leathery, not continuous round the inner end so that the pulp projects into the open core, pulp inclined to be tough, acid and bitter with some sweetness; juice-cells large, distinct from one another.—Swingle tom. cit. 144. C. decumana L. Syst. ed. 12, 508 (1767); Tussac Fl. Ant. iii. t. 17, 18; Descourt. Fl. Ant. iii. t. 220; Macf. in Hook. Bot. Misc. i. 303 & Jam. i. 130; Griseb. loc. cit.; Hook. f. tom. cit. 516; Hume Citrus 51, 52, 127, f. 27; P. Wils. loc. cit. C. Aurantium var. grandis L. Sp. Pl. 783

(1753). C. Aurantium var. decumana L. Sp. Pl. ed. 2, 1101 (1763). C. pompelmos Risso Orang. t. 61–66 (1818). Malus arantia &c. Sloane Cat. 212 & Hist. i. 41, t. 12, f. 2, 3, 4. C. fructu sphærico-obovato maximo &c. Browne Hist. Jam. 309. Limo decumanus Rumph. Amboin. i. 96, t. 24, f. 2. Specimen in Herb. Linn, named by Linnæus.

Shaddock.

Cultivated and spontaneous; Sloane Herb. vii. 113, 115! native of

China, Cochin-china, and Malay Islands.

Tree 12-20 ft. high; young shoots pubescent; spiny when young, becoming less so with age. Flowers large, white, sweet-scented, 3-9 in subterminal axillary racemes which are longer than the petiole; peduncle and pedicels puberulous. Calyx irregularly 4(-5)-toothed. Petals 4 (rarely 5), oblong, dotted with green on the outside. Stamens 30-35. Ovary 11-16-celled. Fruit, juice-cells spindle-shaped. "There are two varieties of shaddock. In var. a. maliformis, the fruit is globose, with the pulp of a pale pink colour, approaching to a very light yellow. In var. b. pyriformis, the fruit is more or less pear-shaped, the pulp is of a crimson colour more or less intense. The second of these varieties is the more esteemed, being sweet and juicy, and having only in a slight and palatable degree the acridity which abounds in the first" (Macfadyen).

8. C. paradisi *Macf. in Hook. Bot. Misc. i.* 304 (1830) & *Jam. i.* 131; leaflet elliptical, rounded at both ends, glabrous, 7–10 cm. l., margin crenulate; petiole narrowly winged; fruit large, globular or pear-shaped, yellow, rind smooth, pulp pale yellow, flavour a pleasant mingling of sweet, acid and bitter, juice-cells tightly bound together.

Generally regarded as a variety of C. decumana Lunan Hort. Jam. ii. 172; Hook. f. loc. cit. (in part) (non L.); Hume Citrus 43–50, 115–126, t. 9; P. Wils. loc. cit. (in part). Malus arantia &c. Sloane Cat. 212 & Hist. i. 41 (in part). C. fructu spherico-

ovato minori &c. Browne Hist. Jam. 309.

Grape Fruit, Forbidden Fruit, Pomelo.

Cultivated and spontaneous; Sloane Herb. vii. 114! Distin! probably

a native of China.

Tree about 30 ft. high. Spines usually short, axillary. Flowers like those of C. grandis Osbeck, solitary or 2-6 in an axillary raceme. Peduncle glabrous, about 1 cm. l. Calyx irregularly 5-toothed. Petals 4, oblong. Stamens about 25.]

5. AMYRIS L.

Resinous, glabrous trees and shrubs. Leaves alternate, or opposite and alternate, 1-3-foliolate or imparipinnate, leaflets opposite, with very numerous pellucid dots. Panicles with numerous flowers, axillary and terminal. Flowers small, white, often 3 together, hermaphrodite or polygamous. Floral parts in 4's. Calyx urceolate, 4-toothed, persistent. Petals 4, imbricate, spreading or bent down. Stamens 8. Ovary 1-celled; ovules 2, pendulous. Drupe small, aromatic, oily; putamen

chartaceous, 1-seeded. Cotyledons thick, plano-convex, dotted with glands; endosperm wanting.

Species 12, natives of the West Indies and of tropical America, north of the equator.

Leaves opposite, or rarely subopposite.

1. A. Elemifera L. Syst. ed. 10, 1000 (1759); leaves opposite; leaflets 3, or on the same branch 3 and 5, 2-6(-7) cm. l.; ovary

Torch-wood.

Sloane Herb. vi. 4! Browne! St. Ann, Purdie! road to Wareka, 300 ft.; Comma Pen, 500 ft.; near Lititz; east of Rifle Range, Kingston, 200 ft.; Long Mt., 900 ft.; Lapland, 1800 ft.; Cane River valley, 250 ft.; Peckham, Clarendon, 2500 ft.; Harris! Fl. Jam. 6673, 7075, 7228, 8610, 8847, 9016, 9192, 10,063, 11,014.—Florida, Key West, Bahamas, Cuba, Hispaniola, Porto Rico, St. Thomas, St. Jan, St. Cruz, Guadeloupe, Les Saintes, Martinique, St. Lucia, St. Vincent, Becquia, Trinidad. The habitat Carthagena quoted by Jacquin is not confirmed by specimens.

Shrub or tree, 12-35 ft. high; twigs, inflorescence, and petioles glabrous. Leaflets lanceolate to broadly ovate or roundish, acute to long acuminate, cuneate to rounded at the base, crenulate or entire, thinly leathery. Callyx about 5 mm. 1., with triangular lobes. Petals elliptical to obovate-elliptical, 2-3 mm. 1., gland-dotted. Gynophore wanting or more or less developed.

The wood is heavy, exceedingly hard, strong, and close-grained; it is very resinous, extremely durable, and can be made to take a beautiful polish. A cubic foot of dry wood weighs about 65 lbs. If it could be obtained in large quantities, it would prove valuable (Sargent).

2. A. balsamifera L. Syst. ed. 10, 1000 (1759); leaves opposite; leaflets 5, or 5 and 3, 4-13 cm. l.; ovary puberulous; drupe ovoid-ellipsoidal or ellipsoidal, 12-14 mm. l.—Macf. Jam. i. 231; Griseb. loc. cit. (excl. syn. Willd. & Kunth); Urb. tom. cit. 292; P. Wils. loc. cit. A. arboreus foliis &c. Browne Hist. Jam. 208 (excl. syn. Sloane). Toxicodendron arborescens Miller Gard. Dict. ed. 8 (1768). Specimen from Browne in Herb. Linn. named in Solander's hand.

Torch Wood, White or Black Candle Wood, Rose-wood. Wright! St. Ann; Bull Bay; Browne! Port Royal Mts., Macfadyen! Distin! Lime savanna, Clarendon, Purdie! March! Jam. 5553, 5913, 6693, 8423, 9172, 11,093, 11,992.—Florida, Cuba, Hispaniola, Mugeres Is., near Honduras, Colombia, Ecuador.

near Honduras, Colombia, Ecuador.

Tree (or shrub) 20-40 ft. high. Rhachis of inflorescence and calyx minutely puberulous or glabrate. Leaflets lanceolate to ovate, acute to long acuminate, cuneate at base, rarely obtuse, crenulate or entire. Calyx about '7 mm. l., with triangular-roundish lobes. Petals elliptical to

obovate-elliptical, about 3 mm. l., gland-dotted.

Wood 2 or 3 ft. in diameter, hard, heavy, and close-grained, with aromatic smell. It takes a fine polish, and is considered valuable for cabinet work. It splits easily into strips, and burns readily with a fragrant smell, so that it is used by the peasantry for firewood and torches. Browne states that in his time it was considered one of the most valuable trees in the island.

3. A. Plumieri DC. Prodr. ii. 81 (1825) (excl. syn. L.); leaves alternate or rarely subopposite; leaflets 3, rarely 5, 5–7 (3–10) cm. l.; petals conspicuously gland-dotted; ovary glabrous; drupe globular, 4–7 mm. l.—Griseb. loc. cit. A. sylvatica Macf. Jam. i. 231 (non Jacq.); Karst. Fl. Col. ii. 109, t. 158, f. III.; Urb. tom. cit. 295; P. Wils. tom. cit. 219. A. maritima Sw. Obs. Bot. 148 (1791); Baill. Shrub 4-15 ft. high, glabrous. Leaflets roundish-ovate, or even somewhat roundish, or ovate, acuminate, acute or rounded at the apex, broadly wedge-shaped or rounded at the base, crenulate, crenate or doubly crenate, membranaceous to papery. Panicle usually terminal. Flowers white. Calyx about 6 mm. 1, with roundish-triangular lobes. Petals elliptical

to obovate-elliptical, 2.5-3 mm. l.

6. SPATHELIA L.

Trees with a simple slender unbranched trunk. Leaves alternate, pinnate with an odd leaflet, borne at the summit of the trunk, leaving conspicuous leaf-scars on falling; leaflets in many pairs, opposite or alternate, with pellucid dots on the margin. Panicles very large, terminal. Flowers polygamous. Calyx 5-cleft; segments spreading, valvate or subvalvate. Petals 5, imbricate. Stamens 5, free. Ovary 3-angled, 3-celled, sterile in the male flowers; style very short, deciduous with the 3 obovate-roundish fleshy papillose stigmas, rudimentary in male flowers; ovules one in each cell, pendulous from the inner angle at the apex. Drupe 3-sided, 3-winged (rarely 2-sided, 2-winged, 2-celled); putamen 3-angled, 3-celled, with resin-canals, cells 1-seeded. Seeds with thickish endosperm; cotyledons linear-oblong. The tree dies after maturing fruit, that is, about six months after flowering.

In the few female flowers which are available for dissection, we find only one ovule which is pendulous from the inner angle at the apex of each ovary-cell. Bentham and Hooker, who describe the ovules as geminate in each cell, place this genus in

Simarubaceæ; Engler places it in Rutaceæ.

Mountain Pride.

Species 5, natives of Jamaica and Cuba—one of the Cuban species is found also in the Bahamas.

Leaflets velvety beneath. Filaments with hairy wings 1. S. sorbifolia. Leaflets glabrous. Filaments without wings 2. S. glabrescens.

1. S. sorbifolia L. Amæn. v. 377 (1760); leaflets velvety on both sides, especially on the midrib, sometimes glabrate on the upper surface; filaments with hirtellous wing-like appendages on

the lower half.—S. simplex L. Sp. Pl. ed. 2, 386 (1762); Gærtn. Fruct. i. 278, t. 58; Willd. Sp. Pl. i. 1496; Hort. Kew. ed. 2, ii. 171; Lun. Hort. Jam. i. 524; Bot. Reg. t. 670; Macf. Spathe caudice simplici, fronde pinnata comosa, racemo spatiosissimo laxo terminali Browne Hist. Jam. 187. Rev. J. Lindsay Ic. ined.

Hope river, Liguanea, Sloane Herb. v. 101, 102! Browne; Shakspear! Purdie! March; Hope, Campbell! hillsides, Gordon Town, Britton, 1! also Harris! Fl. Jam. 6421, 9375.

Tree, 20-25 ft. high, diameter 3 inches near the base. Leaves 4-10(-15) dm. l.; rhachis velvety; leaflets 45-81, alternate, subopposite, oblong, sessile, 2 cm.-2 dm. l., 1-4 cm. br., coarsely crenulate with a gland at the tip of each crenature, truncate to subcordate at the base, apex acuminate, sometimes rounded. Panicle very large, to 18 dm. high, and 24 dm. in diam., branches velvety. Sepals elliptical to obovate-elliptical, glandular at the apex, 3-3.5 mm. l. Petals elliptical, glandular at apex, 5-6 mm. l. Drupe 2-3 cm. l.

Linneus (Sp. Pl. ed. 2) quotes incorrectly from Browne "racemo simplicissimo" instead of "spatiosissimo."

2. S. glabrescens Planch. in Hook. Lond. Journ. Bot. v. 581 (1846); leaflets glabrous on both sides; filaments with rudimentary basal appendages or none.—P. Wils. in N. Amer. Fl. 207 & in Torreya xi. 263.

Swartz! Distin! Wilson! Moneague, Prior! Radnor, Stephens! Stanmore Hill, Malvern, 2400 ft.; near Troy, 2200 ft.; Luana Point; Harris!

Fl. Jam. 8482, 9659, 9822.

Tree, 50-70 ft. high, diameter 9 inches near the base. Leaves 5.5-11. dm. l., rhachis velvety or glabrate; leaflets oblong to oblong-lanceolate, 7-15 cm. l., with a short petiolule or subsessile, apex obtuse to acuminate, base obtuse, or truncate, sometimes more or less cordate, margin coarsely crenate to entire. Paniele large, branches glabrous or velvety. Sepuls oblong-elliptical to oblong-lanceolate, glandular at apex, 4-5 mm.l. Petals 5-9 mm. l. Drupe 2-3 cm. l.

Ruta chalapensis L. (R. graveolens Lun. Hort. Jam. ii. 128, non L.) is noted by P. Wilson (in N. Amer. Fl. xxv. 212) as introduced from the Old World into Central America, Jamaica, and other W. Indian Islands, but we have not seen any evidence that it is naturalized.

FAMILY XLVI. SIMARUBACEÆ.

Shrubs or trees. Leaves alternate, rarely opposite, pinnate, rarely 1-3-foliolate or simple; stipules none. Inflorescence axillary in most, paniculate or racemose. Flowers small, diclinous or polygamous. Calyx with 3-5 lobes or segments. Petals 3-5. Stamens inserted at the base of the disk, as many or twice as many as the petals; anthers introrse, with longitudinal dehiscence. Ovary 2-5-lobed, 1-5-celled, or 3-5 free carpels; styles 2-5. Ovules solitary in the cells (2 in Picramnia and Alvaradoa), attached at the inner angle. Seeds solitary, pendulous (erect in Suriana and Alvaradoa). Endosperm wanting. Cotyledons

Species about 150, natives mostly of the warmer regions of the world.

Leaves simple. Flowers hermaphrodite	1. 2.	Suriana. Castela.
Leaves compound.		
Ovary lobed.		
Ovary 5-cleft Ovary 2-3-lobed	3.	Simaruba.

Inflorescence axillary	6.	Alvaradoa.
	(0 .)

1. SURIANA L.

Sea-shore shrub, covered with capitellate mixed with simple Leaves alternate, clustered together, simple, linearspathulate, thick, without stipules. Flowers subterminal, hidden by the leaves, solitary or few in a raceme, yellow, hermaphrodite. Calvx 5-cleft, imbricate, persistent. Petals 5, as long as the calyx, imbricate. Stamens 10, hypogynous, the 5 opposite the petals shorter and sometimes without anthers. Ovary of 5 distinct carpels, the styles springing from near the base, free. Ovules 2 in each cell, ascending from the base. Ripe carpels 3-5, surrounded by the calyx, 1-seeded; endocarp hard and brittle. Seeds ascending. Embryo horseshoe-shaped; cotyledons flattish; radicle long, superior, descending to the hilum.

Species 1, found on all tropical sea-shores.

S. maritima L. Sp. Pl. 284 (1753); Jacq. Sel. Stirp. Amer. 140; Sw. Obs. Bot. 185; Macf. Jam. i. 235; Griseb. Fl. Br. W. Ind. 58; Engl. in Fl. Bras. xii. pt. 2, 202; Urb. Symb. posed of 4 carpels cohering at the apex; styles 4, short, united below, recurved and stigmatic above; ovules solitary in each cell. Drupes 1-4, fleshy; endocarp hard, brittle. Seed attached laterally at the middle or near the base (C. macrophylla) of the cell; endosperm scanty or wanting (C. macrophylla); cotyledons thick, plano-convex.

Species 11, natives of Central America, tropical S. America,

and Jamaica.

C. macrophylla *Urb. Symb. Ant. v.* 377 (1908). Castelaria macrophylla Small in N. Amer. Fl. xxv. 232 (1911). (Fig. 63.)

Long Mountain, 900 ft.; common on Great Goat Is.; hill behind Ferry Quarry, 200 ft.; Harris! Fl. Jam. 9219, 9347, 9348, 10,047; Little Goat Is., Britton & Hollick, 1843!

Shrub 2-8 ft. high; spines, when present, axillary, 2-3 mm. l. Leaves narrowly or broadly elliptical, sometimes oblanceolate, 2-6 cm. l.; nerves and veins slightly prominent, reticulate, glabrous on the upper surface, minutely puberulous beneath. Flowers subsessile; male, several on very short reduced axillary shoots; female, 2-4, axillary or on a short axillary branch; pedicels 2-3 mm. l. in fruit. Calyx about '7 mm. l., hairy. Petals pink, elliptical, concave, 3 mm. l. Drupe bright scarlet, ellipsoidal-compressed, shortly beaked at the apex, 1-1.5 cm. l.

3. SIMARUBA Aubl.

Trees. Leaves alternate, pinnate with or without an odd leaflet; leaflets mostly alternate, entire. Panicles axillary and terminal. Flowers small, diecious or monecious. Calyx 5-lobed. Petals 5, imbricate. Disk villose. Male flowers: Stamens 10, inserted at the base of the disk, included; filaments with a short scale at the base inside. Female flowers: Staminodes scale-Ovary 5-cleft; styles united; stigmas spreading or Ovules solitary. Drupes 1-5, on the enlarged recurved. receptacle. Cotyledons fleshy.

Species 6, natives of tropical eastern America and the West

Indies.

S. glauca DC. Ann. Mus. Par. xvii. 424 (1811); Planch. in Hook. Lond. Journ. Bot. v. 567; Griseb. Fl. Br. W. Ind. 139; Engl. in Fl. Bras. xii. pt. 2, 224; Sarg. Silv. i. 91, t. 38, 39; Small in N. (A, B, C, E after Sargent.)

S. amara Aubl. (Quassia Simaruba Linn. f. Suppl. 234) occurs in some of the West Indian Islands, but is wrongly stated by Linneus fil. to be a native of Jamaica. The drupe of this species is about the same size as that of S. glauca, and more regular in form, not so compressed and acute on the ventral side.

Quassia amara Linn. fil. is noted by Planchon (Hook, Lond. Journ. Bot. v. 562) as sent from Jamaica by Distin, but it is an introduced plant from tropical S. America. It is readily recognised by the large crimson corolla (3 cm. l.), and the winged petiole.

4. PICRÆNA Lindl.

Trees with bitter juice. Leaves alternate, pinnate with an odd leaflet; leaflets opposite, entire. Panicles axillary, corymbose. Flowers greenish, polygamous. Sepals small, 4 or 5. Petals 4 or 5, subvalvate, not increasing in size after flowering. Disk saucer-shaped in the male flower, rounded, 4–5-lobed in hermaphrodite flowers. Stamens 4 or 5, inserted under the disk. Ovary 2–3-lobed, lobes free; styles 2 or 3, united below, free above; ovules solitary in each cell. Drupes 1–3, subfleshy, endocarp hard and brittle. Embryo undivided.

Species 3 or 4, natives of tropical America.

Bitter Wood, Jamaica Quassia.

Wright! Macfadyen! McNab! Shatton, Westmoreland; Guys Hill, St. Mary; Purdie! Moneague, Prior! March! Old England, Blue Mts.; Gordon Town; Hope, 700 ft.; near St. Ann's Bay; Harris! Fl. Jam. 5458,

7017, 9984, 10,363.—Hispaniola.

Tree 40-60(-80) ft. high. Leaflets narrowly elliptical or oblong-elliptical, unequal-sided, mostly cuneate or acute at the base, 5-12 cm. l. Panicles with long peduncles. Flowers greenish. Sepals 6-7 mm. l. Petals of male flower oblong-elliptical, 2 mm. l.; of hermaphrodite flower oblong-lanceolate, 3 mm. l. Stamens about 4 mm. l. in the male flower, 2-2.5 mm. l. in the hermaphrodite flower. Drupes globular or obovoid-globular, black, 6-7 mm. l.

The wood is largely exported from Jamaica, and is the "quassia" of commerce. Locally the wood is used for ceilings, bedsteads, and presses, as it is objectionable to insects. Quassia wood is a pure bitter tonic and stomachic. It is a valuable remedy in atonic dyspepsia, in debility, and in convalescence after acute diseases. "Bitter Cups" are manufactured from the wood. The wood is sometimes used by brewers as a substitute for hops.

(Bentley and Trimen.)

Note to Picrania amara in "Medicinal Plants in Jamaica" by Dr. Wm. Wright in London Medical Journal viii. 275 (1787) by the editor,

Dr. S. F. Simmons:

In 1772 Dr. Wright discovered the tree which yields the simarouba of the shops, and the year following sent a botanical account of it to the late Prof. Hope at Edinburgh, under the title of Quassia Simarouba. At the same time he sent specimens of it to the late Dr. Fothergill, who transmitted them to the celebrated Linnæus at Upsal. The latter communicated this discovery to Prof. Murray at Göttingen, who has mentioned it in the third volume of his Apparatus Med. p. 458 (German edition, Arzneyvorrath iii, 522).

P. antillana (Rhus antillana Eggers Fl. St. Croix and Virgin Is. 41 (1879); Picrasma antillana Urb. Symb. Ant. v. 378 (1908)), Bitter Ash, of the lesser Antilles, included by Swartz and other authors in the above species, has drupes about 1 cm. l., and leaflets with obtuse or rounded base.

5. PICRAMNIA Sw.

Shrubs or trees, often intensely bitter. Leaves alternate, pinnate with an odd leaflet; leaflets usually alternate. Spikes or racemes opposite the leaves, pendulous. Flowers diœcious, sometimes polygamous, small, in clusters, racemes, or panicles. Calyx 3-5-cleft, imbricate. Petals 3-5, rarely none, narrow, imbricate. Stamens of the male flower 3-5, opposite the petals, inserted under the disk; of the female flower reduced to linear staminodes. Pistil generally wanting in the male flowers. Ovary 2-3-celled; style short, 2-3-cleft. Ovules 2, collateral, near the apex of the cells. Berry 1-2-celled, cells 1-seeded. Embryo undivided.

Species about 25, natives of tropical America, including the West Indies.

1. P. Antidesma Sw. Prodr. 27 (1788); parts of the flowers in 3's; clusters of flowers in racemes, simple or 2-branched near the base, usually longer than the leaves.—Sw. Fl. Ind.

There is a specimen from Jamaica from Swartz in Herb. Mus. Brit.

Majoe Bitter, Macary Bitter.

Between St. Jago de la Vega and Passage Fort; Angels; Sloane Herb. vii. 22 (& opp. 21)! Broughton! Swartz! Macfadyen! Distin! Great Valley, Manchester, Purdie! Prior! March! Silver Hill. Mt. Diablo; Mona woodland, 600 ft.; Long Mountain, 900 ft.; Stanmore Hill, Malvern, 2400 ft.; between Hardware Gap and Rose Hill, 3700 ft.; Harris! Fl. Jam. 5434, 7028, 8855, 9058, 9754, 9770, 9949, 10,136; Union Hill, Moneague, Britton and Hollick, 2801!—Central America. Swartz gives Hispanick also as a habitat Hispaniola also, as a habitat.

Shrub or tree, 6-15 ft. high. Leaflets 5-9 or more, lanceolate-elliptical to ovate-lanceolate, acuminate, usually unequal-sided, glabrous, 5-10 (2·5-12) cm.l. Inflorescence puberulous or glabrescent. Male flowers: Calyx 3-cleft, 1.5-1.7 mm. l.; segments ovate, acute. Petals 3, greenishyellow, obovoid, somewhat longer than the calyx. Stamens 3, about 3 mm. l. Female flowers: Calyx 3-cleft, about 1 mm., l.; segments elliptical, obtuse. Petals 3, oblong or oblong-elliptical. Style 2-cleft. Berries obovate-globular, 12-14 mm. l., scarlet, at length black.

"This shrubby tree affords a bitter less intense than that of the Quassia or Simaruba [Picræna excelsa], but much more grateful... The bark has been given with success as an alterative in constitutional affections, connected with syphilis and yaws, and as a tonic in debility of

the digestive organs, and in intermittent fever " (Macfadyen).

2. P. pentandra Sw. Fl. Ind. Occ. 220 (1797); parts of the flowers in 5's, clusters of flowers on a panicle with several branches, usually shorter than the leaves.—Rich. in Sagra Cub. x. 156, t. 36 bis; Planch. tom. cit. 577; Griseb. op. cit. 140; Small tom. cit. 237. P. micrantha Tul. Ann. Sc. Nat. sér. 3, vii. 262 (1847). P. antidesmoides Griseb. loc. cit.

"Crescit in Jamaica (Herb. Mus. Reg. Par.—Specim. ex Herb. cl. Hook. deprompto)." Tul. loc. cit.—Florida, Bahamas, West Indies.

Shrub or small tree, puberulous on the younger parts. Leaflets 5-9, elliptical or lanceolate, acuminate, often somewhat unequal-sided, glabrous, 5-10 (3-12) cm. l. Inflorescence puberulous with yellow hairs. Male flowers: Calyx 5-cleft, about 2 mm. l.; segments oblong, toothed above and passing into a more or less acuminate or acute apex. Petals 5, linearlanceolate, 2-2.5 mm. l., sometimes slightly denticulate near the apex. Stamens 5, about 3 mm. l. Female flowers: Calyx 5-cleft, about 1 mm. l.; segments ovate, acute. Petals 5, linear, a little longer than the calyx. Style 2-cleft. Berry ellipsoidal, 10-13 mm. l., reddish-brown.

We have not seen a specimen from Jamaica, but, judging from the

distribution, there is every reason to suppose it occurs.

6. ALVARADOA Liebm.

Shrubs or small trees, with bitter juice. Leaves alternate, imparipinnate; leaflets alternate. Racemes axillary and terminal, many-flowered. Flowers very small, tomentose, diecious. Calyx 5-cleft, valvate. Petals 5, filiform, or wanting. Male flowers: Petals 5, filiform (in A. amorphoides). Disk large, deeply 5-lobed. Stamens 5, alternate with the lobes of the calyx, inserted between the lobes of the disk; anthers 2-celled, connective thickened, dorsal. Female flowers: Petals 5, stamens wanting. Ovary 2-3-celled, one cell only fertile; styles 2-3; ovules 2 in the fertile cell, erect from the base of the partition wall. Capsule very compressed or 2-3-winged, 2-3-celled; cells 1-seeded. Seed one, erect, compressed, without endosperm. Embryo broadly oblong, compressed. Cotyledons flat, foliaceous, fleshy. Radicle inferior.

Species 4, one a native of Central America, Florida, the Bahamas, and Cuba, one of Hispaniola, one of Cuba, and the

fourth of Jamaica.

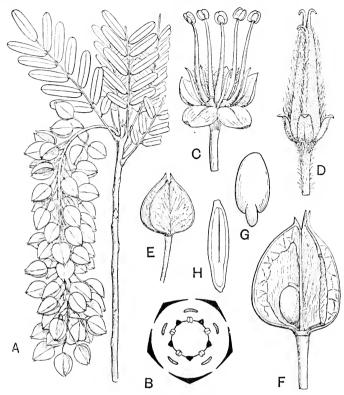

Fig. 67.—Alvaradoa.

Shrub or small slender tree, 3-25 ft. high. Leaves, 1-2 dm.l. Leaflets, 15-45, leathery, oblong or oblong-elliptical, 1-3.5 cm.l., gradually becoming smaller towards the base of the rhachis, glabrous, apex emarginate, lower surface lighter-coloured, margin revolute. Stamens twice as long as calyx (fide Grisebach). Capsules ovate-roundish, glabrous. Flowers not seen.

FAMILY XLVII. BURSERACEÆ.

Trees or shrubs. Leaves alternate, without stipules, simple or imparipinnate; leaflets opposite. Flowers racemose or paniculate, hermaphrodite or polygamo-diœcious. Calyx 3-6-lobed. Petals 3-6, deciduous. Disk free or adnate with the tube of the calyx. Stamens generally twice as many as the petals, inserted on the disk. Ovary 2-5-celled. Ovules 2 in each cell, attached near the apex at the interior angle of the cell. Fruit drupaceous. Seeds without endosperm. Cotyledons contortuplicate; radicle superior.

Species 400 or more, natives of the tropics.

1. BURSERA L.

Trees with balsamic resinous juices. Leaves compound or simple. Flowers small, polygamous, in lateral panicles or racemes, sometimes clustered. Calyx small, with 3-6 lobes. Petals 3-6, valvate. Stamens twice as many as the petals, inserted at the base of the annular disk. Ovary 3-celled; style very short; stigma obtusely 3-lobed. Drupe indistinctly 3-angled; epicarp leathery-fleshy, resinous, separating into three valves; stone usually solitary, bony, triangular, united to a persistent fleshy axis, 1-celled, 1-seeded.

Species 100, natives of the tropics, chiefly America.

(After Sargent.)

with glandular dots, scaling off in thin papery red-brown pieces. Leaflets 9-3 (13-1), oblong-ovate, acuminate, somewhat unequal-sided, oblique at the base, entire, glabrous on both sides except at base of midrib beneath, veins reticulate and prominent beneath, 6-8 (3-11) cm. 1. Flowers appearing before the leaves or while they are still young, white; panicles many-flowered, of male flowers to 17 cm. l., of fertile flowers about half as long. Male flowers: Calyx 5-lobed, 1-1.5 mm. l. Petals 5, 2.5-3 mm. l., spreading, ovate-elliptical. Stamens 10, about as long as the petals. Hermaphrodite flowers: Sepals and petals 3. Stamens 6, about half as long as petals, with smaller anthers. Disk shallowly-lobed. Drupe 1-1.5 cm. l.; epicarp dark red; nutlet covered with a light pink skin.

This tree sheds its leaves during March and April, and, after remaining bare for a few weeks, produces its flowers and young leaves. All parts abound with a glutinous balsamic juice of a turpentine odour. The juice forms, on inspissating, a clear transparent gum-resin, "budge gum," of a dark green colour, resembling gum mastic, and capable of being used instead of it as a transparent varnish (Macfadyen). The wood is very light, spongy, soft, and weak. Branches planted in the ground quickly and readily grow into trees, so that they may be used as "grow-posts" to form a fence. The wood, both of this species and of B. simplicifolia, is used for match-sticks in the local match factory.

2. B. Hollickii comb. nov.; leaves compound; leaflets leathery; bark persistent.—Terebinthus Hollickii Britton in Bull. Torr. Bot. Cl. xxxv. 341 (1908). Elaphrium Hollickii J. N. Rose in N. Amer. Fl. xxv. 246 (1911).

Dry rocky hillside, Port Henderson, Britton & Hollick, 1816!

Tree to 18 ft. high; trunk 2·5 dm. in diam.; bark reddish-grey outside, red inside, close, not peeling off in papery layers. Leaflets 3-7, elliptical or ovate-elliptical, 3-6 cm. 1, entire, shortly acuminate, glabrous, veins inconspicuous on the upper surface, prominent beneath. Common petiole and rhachis pubescent. Flowers not known. Inflorescence a raceme, simple or slightly compound, few-fruited, 4-7 cm. 1, rhachis pubescent. Fruit 8-10 mm. 1, about 7 mm. thick; pedicels 4-5 mm. 1.

3. B. simplicifolia DC. Prodr. ii. 78 (1825); leaves simple.—
Macf. Jam. i. 230; Engl. tom. cit. 38; Urb. Symb. Ant. vi. 102.
Amyris Lunani Spreng. Syst. ii. 217 (1825) (according to Urban loc. cit.). Terebinthus simplicifolia Britton in Bull. Torr. Bot. Cl. xxxv. 342 (1908). Elaphrium jamaicense Rose in N. Amer. Fl. xxv. 244 (1911).

Black Birch.

Coastal limestone hills, but somewhat rare; Macfadyen! Great Goat Is.; Long Mountain, south side, 900 ft.; road to Wareka, 100 ft.; Harris!

Fl. Jam. 9326, 9591, 10,166, 11,946.

Tree with spreading head, 15-40 ft. high; bark of trunk rough and scaly. Leaves elliptical, sometimes obovate, somewhat leathery, entire, glabrous on both sides, nerves slightly prominent on both sides, veins obscure, 7-3 cm. l. Flowers greenish-yellow or white, fragrant; panicles with few flowers, 4-6 cm. l. Male flower: Calyx about 1.3 mm. l. with 4 segments. Petals 4, about 2.3 mm. l., valvate, spreading, ovate-elliptical. Stamens 8, shorter than the petals. Hermaphrodite flower: Calyx about 1 mm. l., with 3 segments. Petals 3, about 2 mm. l., oblong-elliptical. Stamens 6, much shorter than the petals. Style wanting; stigma indistinctly 3-lobed. Fruit 8-9 mm. l.

2. PROTIUM Burm.

Trees. Leaves imparipinnate with entire leaflets in 1-5 pairs. Flowers hermaphrodite or polygamous, subsessile or sessile, crowded on short branches of a panicle. Calyx small, 4-5-lobed; lobes imbricate at base in bud. Petals 4-5, valvate.

Stamens 8-10, inserted at base of disk. Disk 8-10 crenate, annular or cup-shaped in hermaphrodite flowers, flat-convex in male flowers. Ovary 4-5-celled; style varying in length; stigma 4-5-lobed. Drupe globular or ovoid, often apiculate with the persistent style, composed of 1-5 cocci, each 1-celled, 1-seeded.

Species about 50, natives of the tropics, chiefly American.

Wright! in Herb. Kew.—Guadeloupe, Dominica, Martinique, St. Lucia, St. Vincent.

Leaves, common petiole, 2–8 cm. 1., flattened above, petiolules more or less thickened at the apex, lateral '6-1'2 cm. 1., terminal 1'5-3 cm. 1.; leaflets 5-7 (3) ovate, ovate-elliptical, or elliptical-oblong, acuminate, base more or less oblique in lateral leaflets, 7-13 cm. 1., 3-5'5 cm. br.; nerves and densely reticulated veins prominent on both sides, leathery, glabrous. Panicle 3-5 cm. 1., glabrous, branching from the base; pedicels 2-3 mm. 1. Calyx: lobes 5, shortly triangular. Petals 5, 2'8-3 mm. 1., green, ovate-lanceolate, margin densely and minutely tomentose. Stamens 10, filaments 1'2-1'5 mm. 1. Disk fleshy. Ovary glabrous; style very short;

stigma 5-lobed. Fruit of 2 carpels broadly ovate, 2.2-2.7 cm. l., 1.5-2 cm. br.; of 1 carpel ovate-elliptical, 3-cornered 1-1.5 cm. br.

P. Copal Engl. is a native of Mexico. There is a specimen in Herb. Miller in Herb. Mus. Brit. marked "Jamaica?" It differs from the above species in the parts of the flowers being in 4's, in the oblong apiculate leaflets, and in the longer Janicle to 12 cm. l. with puberulous rĥachis.

FAMILY XLVIII. MELIACEÆ.

Trees or shrubs, the wood of which is often hard, coloured, and sometimes sweet-scented. Leaves alternate, without stipules. generally pinnate, 3-foliolate in Trichilia polyneura, 2-pinnate in Melia Azederach; leaflets entire. Flowers rather small, paniculate. Calyx 4-5-lobed, imbricate. Petals 4-5, imbricate, convolute or valvate in bud. Disk various, sometimes inconspicuous, sometimes ring-like, or more or less enclosing the ovary; in Cedrela the disk forms a column to which both the petals and the filaments are attached half-way from the base. Stamens 8-10 (in Cedrela 5), filaments attached outside the base of the disk, united more or less into a tube; anthers sessile or shortly stalked, attached on the inside of the tube, in Cedrela the filaments are distinct above the attachment to the column. Ovary 2-5-celled. Ovules in each cell usually 2, collateral or superposed, in Cedrela and Swietenia 8-12; raphe ventral; micropyle superior. Fruit a capsule or drupe. Seeds with or without endosperm.

Species nearly 600, natives of warm regions of America and

Asia, rarer in Africa.

Stamens more or less cohering to form a tube.

Leaves pinnate. Fruit a capsule. Seeds winged...... 3. Swietenia.

Seeds not winged.

Capsule 3-2-valved or not opening. Leaves

[Leaves 2-pinnate. Fruit a drupe Stamens and petals attached below to the column, free above 4. Cedrela.

1. TRICHILIA L.

Trees or shrubs. Leaves imparipinnate or (in T. polyneura) 3-foliolate. Panicles axillary, or terminal and axillary, manyflowered. Calyx small with 5 or 4 teeth or segments. Petals 5 or 4, imbricate or valvate. Stamens 10 or 8; filaments united at the base and more or less adhering above, united to the apex in T. moschata; anthers terminal. Ovary on a disk, 3-2-celled; ovules 2 or 1, at the central angle of each cell; stigma usually

3-2-lobed, capitate. Fruit a subglobose leathery capsule, 3-2-celled, loculicidally 3-2-valved, generally with 1 or 2 seeds in each cell. Seeds without endosperm, enclosed in a fleshy, usually scarlet, aril; radicle superior.

Species about 130, natives of tropical America (including

West Indies), and a few in tropical Africa.

Leaves with more than 1 pair of leaflets.

Leaflets in 7-11 pairs, opposite or alternate................ 1. T. hirta. Leaflets in 3-4 pairs.

Leaves 3-foliolate 6. T. polyneura.

1. T. hirta L. Syst. ed. 10, 1020 (1759) & Amæn. v. 378; leaflets opposite or alternate, in 7-11 pairs, glabrous on upper surface, subhirsute beneath on midrib and nerves; panicles axillary, long-peduncled, branches short, subequal, mostly in clusters of 2 or 3; petals glabrous; filaments emarginate at apex, glabrous outside, hirtellous inside and on the margin; anthers hirtellous.—Griseb. Fl. Br. W. Ind. 129; Urb. Symb. Ant. iv. 327. T. subhirsuta, foliis pinnatis ovatis, racemis alaribus Browne Hist. Jam. 278. T. spondioides Jacq. Enum. Pl. Carib. 20 (1760) & Sel. Stirp. Amer. 128; Sw. Prodr. 67 & Fl. Ind. Occ. 730; A. Juss. in Mém. Mus. Par. xix. 236, t. 18, f. 18a (anthers should have been represented hirtellous); Macf. Jam. 5212, 7693.—Cuba, Is. of Pines, Hispaniola, Porto Rico, St. Thomas, St. Cruz, St. John, Mexico, Tres Marias Is., Colombia, Venezuela.

An authentic specimen collected by Swartz in Hispaniola is in Herb.

Mus. Brit.

A shrub or tree, 10-20 ft. high. Leaves 4·5(-2) dm. l.; petiole 5-13 cm. l.; leaflets elliptical to oblong-elliptical, acuminate, base very unequal, 5-10 cm. l., those in the middle largest. Inflorescence 5-20 cm. l.; peduncle to 11 cm. l. Flowers greenish-white or-yellow. Calyx·7 mm. l., 5-cleft, glabrous, but sometimes subciliate at the apex of the deltoid segments. Petals 2·5-4 mm. l., 5, elliptical to oblong, valvate. Filaments 2 mm. l., 10; anthers 1 mm. l. Ovary hirtellous on a glabrous shallow disk. Style about as long as the ovary, hairy. Stigma globular, depressed above. Capsule globular, about 1 cm. in diam., pubescent-tomentose or glabrescent, 3-(2)-valved. Seeds oblong-ovoid, covered with a red aril.

2. T. moschata Sw. Prodr. 67 (1788); leaflets alternate, 7-9, glabrous, or sometimes minutely tomentose beneath and hirsute along the midrib; panicles axillary; petals puberulous; staminal tube glabrous, a pair of awl-shaped teeth alternating with the anthers; capsule 1.5 cm. l., 2-4-valved.—Sw. Fl. Ind. Occ. 735; Macf. Jam. i. 170; C. DC. tom. cit. 686. T. membranacea Macf. Jam. i. 171 (1837). T. Distini C. DC. tom. cit. 698 (1878). Laurus folio breviore &c. Sloane Cat. 136 & Hist. ii. 21, t. 166, f. 1. Moschoxylum Swartzii A. Juss. tom. cit. 239 (1830); Wils. loc. cit.; Griseb. op. cit. 130.

Muskwood.

Northern parts of the Island, Sloane Herb. v. 74! Wright! Robins! Macfadyen! Distin! Prior! Green Valley, Blue Mts.; banks of Black River; near Beaufort, Westmoreland, 1400 ft.; Negril; near Montego Bay; Toms Cave Wood, Upper Clarendon, 2500 ft.; Peckham, Clarendon, 1400 ft.; Peckham, Clarendon, 2500 ft.; Peckham, 2500 ft.; 2300 ft.; Soho, St. Ann, 1400 ft.; *Harris*! Fl. Jam. 5637, 9852, 9908, 10,230, 10,239, 10,319, 10,955, 11,081, 12,027.

Tree 15-40 ft. high. Leaves 1-3 dm. l.; petiole 1.5-2.5 cm. l.; leaflets elliptical or oblong-elliptical, apex abruptly acuminate, glabrous, 6-16 cm. l. Inflorescence to 10 cm. l.; rhachis puberulous or glabrate. Calyx about 1.5 mm. l., puberulous; lobes 5 (or 4), broadly deltoid. Petals 5 (or 4), adherent below, greenish-yellow or pale yellow, ovate-oblong, nearly 3 mm. l., valvate, apex hooded. Staminal-tube about 1.5 mm. l., with 8 or 10 excellent puberulous; puberulous plants by Pristil with 8 or 10 sessile anthers; anthers about half as long as the tube. Pistil about as long as the staminal-tube; style shorter than the ovary; stigma globular; ovary tomentose. Capsule tomentose, ellipsoidal, 1-seeded. Seed, when ripe, as long as the capsule; aril scarlet.

The figure in Sloane is drawn from a specimen in which the leaflets and panicles have been placed haphazard on the twigs, and is therefore not

a true representation of this species.

3. T. Harrisii Britton in Bull. Torr. Bot. Club xxxv. 568 (1908); leaflets alternate, 5-9, glabrous; panicles axillary; capsule to 2.5 cm. l., surface more or less wrinkled, not opening or only after some time.

In woods, Dolphin Head; Harris! also Britton 2269! Fl. Jam. 10,282,

10,286.

Tree 20-30 ft. high; twigs glabrous. Leaves 2-3 dm. l.; petiole 1.5-2.5 cm. l.; leaflets elliptical or oblong-elliptical, abruptly acuminate, 7-17 cm. l. Fruiting panicles 4-15 cm. l.; rhachis puberulous or glabrate. Flowers not known. Capsule ellipsoidal to globular, densely tomentose, 1-seeded.

Urban (Symb. Ant. vi. 96) suggests that T. Harrisii Britton is only a form of T. moschata Sw., but this can only be decided by the examination

of further material.

4. T. glabra L. Syst. ed. 10, 1020 (1759) & Amæn. v. 378; leaflets opposite, in 3-4 pairs, glabrous except for a hairy membranous expansion usually occurring in the axils of the nerves beneath; panicles somewhat corymbose, terminal and crowded in the upper axils; petals minutely tomentose; filaments puberulous-tomentose on both sides; anthers glabrous.—A. Juss. tom.

united at the base, more or less adhering above, about 1.5 mm. l.; anthers linear-lanceolate, nearly 1 mm. l. Pistil as long as the stamens, glabrous, on a shallow disk; style much shorter than the ovary; stigma indistinctly 3-lobed; ovary 3-celled. Capsule 3(-2)-valved, about 1 cm. l.; aril red.

6. T. polyneura *Urb. Symb. Ant. v.* 380 (1908); leaflets 3.

Papine estate, St. Andrew, 900 ft.; Long Mountain, west, near Kingston, 700 ft.; Harris! Fl. Jam. 8380, 8860.

Shrub or slender tree, sometimes with several stems, 15-20 ft. high. Leaflets narrowly elliptical or obovate-oblong, apex generally rounded, base acute, glabrous, leathery, nerves on both sides densely net-veined, prominulous, 3·5-7 cm. l.; petiole 2-1 cm. l. Panicles raceme-like, with very short branches. Peduncle ·5-2·5 cm. l.; branches 1-3 mm. l., 3-1-flowered. Calyx about 1.5 mm.l., puberulous, with 4 or 5 short lobes. Petals 4 or 5, white, lanceolate- or oblong-elliptical, 3.3 mm. l., tomentose

outside. Stamens alternately longer and shorter; filaments glabrous, united in a tube for about three-quarters of their length, the longer filaments 2 mm. l., free above the tube, 2-toothed, one or more of shorter stamens sometimes abortive. Ovary very hairy, with erect hairs; style very short; stigma capitate. Capsule 13-18 mm. l., covered with brownish tomentum, 3-valved, valves keeled along a median line inside, leathery. Seed solitary, about 14 mm. l.

2. GUAREA L.

Trees or shrubs. Leaves pinnate, continuing for some time to produce new leaflets at the apex. Panicles axillary. Flowers rather small. Calyx short, cup-like, with 4 teeth. Petals 4(-5). Stamens 8; mouth of staminal-tube entire or slightly crenate; Ovary 4-celled. Ovules in each cell, 1 or 2 anthers sessile. superposed. Fruit a leathery or woody capsule, 4-celled, opening at length loculicidally with 4 valves. Seeds 1 or 2 in each cell, enclosed in an aril; cotyledons superposed; radicle dorsal.

Species about 90, mostly natives of tropical America, including the West Indies, a few in tropical Africa.

St. Cruz, Montserrat, Guadeloupe.

Tree 15-40 ft. high. Leaves, petiole and rachis 3-22 cm. 1. Leaflets in 2-5 pairs, opposite (sometimes alternate), elliptical or lanceolate-elliptical, apex often shortly acuminate, glabrous but more or less puberulous on nerves beneath, bearded in axils of nerves beneath, 4-20 cm. l. Inflorescence racemose, lax-flowered, with occasional very short 2-5-flowered branches, 2-25 cm.l.; pedicels 2-4 mm.l. Flowers white, fragrant. Calyx minutely and sparsely puberulous or glabrescent, 1-3 mm.l., subentire or 4-lobed, teeth 4, minute, distant. Petals 4 or 5, more or less minutely puberulous, especially towards the apex, valvate, free or adhering near base, 6-7 mm. 1., oblong, apex subobtuse. Staminal tube glabrous. Ovary glabrous, sessile on the short disk. Style glabrous, about as long as the ovary. Capsule globular, about 2 cm. in diam., 2-4-celled with 1 seed in each cell. Seed 1.5 cm. l.; aril scarlet.

All parts of this tree, especially the bark, have a strong smell of musk. The powdered bark is said to be a good emetic. The wood is red, soft, and

splits easily.

MELIA L.

Trees or shrubs. Leaves simply pinnate or 2-3-pinnate, with an odd leaflet, 2-pinnate in M. Azederach. Panicles axillary, with numerous flowers. Calyx 5-6-cleft, imbricate in bud. Petals 5-6, linear-spathulate, convolute, spreading. Staminal tube long, slender, cut at the apex into numerous linear strips. Anthers 10, sessile within the tube at apex. Disk ring-like. Ovary 5-6-celled; ovules 2, superposed, in each cell; style long, slender; stigma capitate, 5-6-lobed. Fruit a somewhat fleshy drupe; stone 1-5-celled, with 1 seed in each cell. Seeds pendulous, with foliaceous cotyledons; endosperm scanty or wanting.

Species about 12, natives of tropical Asia and Australia, one species (M. Azederach) widely subspontaneous or cultivated throughout the tropics.

M. Azederach L. Sp. Pl. 384 (1753); C. DC. in Fl. Bras. xi pt. 1, 167, t. 50 & D.C. Monog. Phan. i. 451; Descourt. Fl. Ant. i 210, t. 26; Bot. Mag. t. 1066; Cook & Coll. in Contrib. U.S. NatHerb. viii. 190, t. 45; Watt Econ. Prod.; M. Azederach var. sempervirens Sw. Obs. Bot. 171 (1791). Urb. Symb. Ant. iv. 325. M. sempervirens Sw. Prodr. 67 (1788) & Fl. Ind. Occ. 737; Bot. Reg. t. 643; Wright Mem. 269; Macf. Jam. i. 167; Griseb. Fl. Br. W. Ind. 128. Specimen in Herb. Hermann in Herb. Mus. Brit. and one in Herb. Linn. named by Linnæus.

Hoop Tree, West Indian Lilac, Bead Tree. Common; Macfadyen! March! Liguania plain, Campbell! also Harris! Fl. Jam. 6232, 7359, 7715, 8372; not mentioned by Sloane or Browne, and therefore probably of late introduction, now subspontaneous and cultivated .- Found now throughout the tropics, a native of northern India, and of Persia and China.

Shrub or tree (to 40 ft. high in India). Leaves 2-pinnate, 2-4 dm. l.; pinnæ in 2-5 pairs, with an odd pinna, opposite; leaflets subovate-lanceolate, acuminate, base somewhat unequal, margin serrate, glabrous, 2-7 cm. l. Flowers showy, lilac or blue mixed with purple and white, honey-scented. Sepals 1.5-2 mm. l., puberulous. Petals 7-9 mm. l. Staminal-tube cylindrical, 10-ribbed outside, hairy within; anthers oblong, rellow. Opens, glabrous, 5 colled; etigms, 5 lebed. Press ollipseidel. yellow. Ovary glabrous, 5-celled; stigma 5-lobed. Drupe ellipsoidal, yellow, about 1·5 cm. l., 4-5-celled.

The leaves and dried fruit are used in India to protect clothes, books,

papers, &c., from the ravages of insects. The stone from the fruit is used all over India as a bead, being perforated and strung into necklaces and

rosaries. (Watt.)]

3. SWIETENIA L.

Tree with dark red wood. Leaves abruptly pinnate, alternate, glabrous; leaflets opposite, stalked. Flowers small, on corymb-like branches of axillary and subterminal panicles. Calyx 5-lobed. Petals 5, convolute in bud. Stamens united into an urn-shaped tube with 10 teeth; anthers attached internally between the teeth. Ovary 5-celled. Ovules about 12 in each cell, horizontal on the central axis. Fruit a woody capsule, septicidally 5-valved from the base; valves 2-lamellate; axis 5-angled, 5-winged at base. Seeds numerous, pendulous, with a terminal oblong wing. Cotyledons closely attached together and to the fleshy endosperm; radicle papillæform, opposite the chalaza.

Species 2, one a native of the West Indies, Central America

and Peru, the other of the Pacific coast of Mexico.

S. mahagoni Jacq. Enum. Pl. Carib. 20 (1760) & Sel. Stirp. Amer. 127; L. Sp. Pl. ed. 2, 548; Descourt. Fl. Ant. ii. t. 99; Tussac Fl. Ant. iv. 65, t. 23; Hook. Bot. Misc. i. 21, t. 16, 17; Macf. apex acute, cuspidate, glabrous, 8-3 cm. l. Calyx about 1 mm. l., lobes rounded, glabrous. Petals white, elliptical, about 3.5 mm. 1. Staminal tube about 3 mm. 1. Capsule about 1 dm. 1. Seeds about 6 cm. 1.

Browne in 1756 wrote: "This tree grew formerly very common in Jamaica, and while it could be had in the low lands, and brought to market at an easy rate, furnished a very considerable branch of the exports.

It thrives in most soils, and varies both its grain and texture with each; that which grows among the rocks is smaller, but very hard and weighty, of a close grain, and beautifully shaded; while the produce of the low and richer lands is observed to be more light and porous, of a paler colour and open grain. . . It is a pity that it is not cultivated in the more convenient waste lands. It is a very strong timber, and answers very well in beams, joists, planks, boards and shingles"; these may be seen in old houses. The most beautiful part of the wood is that obtained by sawing across the bottom of the stem and root. The bark is astringent, and has been recommended in decoction for diarrhoa. (Macfadyen.)

4. CEDRELA L.

High trees with coloured wood. Leaves abruptly pinnate, rarely imparipinnate; leaflets in many pairs. Panicle large, terminal. Calyx 5-lobed. Petals 5, imbricate, more or less keeled inside, and attached by the keel to the column. Disk forming a column. Stamens 5, adherent to the column, becoming free at its apex. Ovary sessile at the apex of the column, 5-celled. Ovules 8-12 in each cell, in two series, pendulous from the axis. Fruit a capsule, 5-celled, septifragally 5-valved from the apex, valves 2-lamellate becoming free from the septa-bearing Seeds pendulous, winged below; endosperm scanty; cotyledons flat, subfoliaceous; radicle exserted, superior.

Species 8 or 9, natives of tropical America, including the

West Indies.

C. odorata L. Syst. ed. 10, 940 (1759); Macf. Jam. i. 173; Griseb. Fl. Br. W. Ind. 131; C. DC. in DC. Mon. i. 737; Cook & Collins in Contrib. U.S. Nat. Herb. viii. 110; Urb. Symb. Ant. iv. 324. Cedrus odorata Mill. Gard. Dict. ed. 8 (1768). (Fig. 73.)

Jamaican, West Indian, Spanish, or Honduras Cedar. Wright! Cuming! Wilson! Prior! Hitchcock; Port Royal Mts., Bot. Dept.! Hope grounds, Harris! Fl. Jam. 11,705.—Cuba, Is. of Pines, Cayman, Porto Rico, Antigua, Guadeloupe, Martinique, St. Lucia, Grenada, Trinidad, tropical continental America.

A timber tree, 40-80 ft. high; trunk long, straight, 4-6 ft. or more in

diam. Leaves about 3 dm. l., deciduous, renewed in the spring at time of flowering; leaflets opposite, in 7 or 8 pairs, unequal-sided, oblong-elliptical, acuminate, base rounded, unequal, glabrous, 7-12(-15) cm. l. Calyx minutely puberulous or glabrous, about 1.5 mm. l., irregularly 5-lobed. Petals oblong, about 6 mm. l., densely puberulous with yellowish hairs. Stamens included. Ovary glabrous, stigma round-compressed, 5-furrowed on the apex. Capsule about 4 cm. l. Seed about 2.5 cm. l., wing about 1.5 cm. l.

"This is one of the most valuable timber trees of the Island. wood is of a reddish brown colour and has a pleasant smell. The leaves, bark, and flowers of the growing tree on the contrary give out, especially

when young and after rains a most disagreeable odour. . . . As a timber it is superior to pitch-pine, and is employed for similar purposes. It is particularly recommended for wainscoting rooms, and for chests and the inside work of clothes' presses and drawers, from the circumstance that vermin are not known to breed in it. This may be ascribed partly to the strong odour it exhales, and also to the bitter taste of the wood itself. . . . One of the principal purposes for which the cedar is employed, is for splitting into shingles to cover houses. They are very durable, and usually last for 15 years" (Macfadyen). In Porto Rico, according to Cook & Collins, the heavier, more compact, and darker coloured variety, called "cedro macho," is preferred to mahogany for the interior of houses;

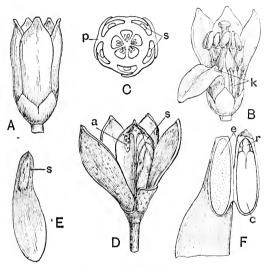

Fig. 73-Cedrela odorata L.

A, Flower × 4.
B, Ditto with one petal removed; k, keel of petal attached to the ovary.

C, Ditto cut across, enlarged, showing the attachment of the petals and stamens

to ovary; s, filaments; p, petal. D, Capsule with one valve cut away $\times 3$,

embryo.

F. Ditto cut lengthwise $\times 2$; e, endosperm; c, cotyledon; r, radicle.

the lighter, less compact, and light coloured variety, called "cedro hembra," is used extensively in making cigar boxes, as well as for the same purposes as the other variety. The weight is 28 lbs. to 39 lbs. per cubic foot.

"An amber-coloured gum, resembling gum arabic; in its properties, may be obtained in considerable quantities, by making incisions in the

bark" (Macfadyen).

This tree is recommended for planting systematically in odd corners of estates; it grows readily from seeds or cuttings; fresh posts put into the ground, will grow.

FAMILY XLIX. MALPIGHIACEÆ.

Trees or shrubs. Leaves opposite and entire in Jamaican species (but dentate-spiny in Malpiqhia cocciquea). Inflorescence indefinite, generally terminal. Flowers hermaphrodite. Calyx 5-cleft, imbricate, 4(-5) of the lobes with 2 glands outside, rarely wanting. Petals 5, clawed, convolute. Stamens 10, hypogynous or almost perigynous; filaments generally more or less united at the base. Carpels 3, more or less united into a 3-celled ovary, or separate, each with one ovule. Styles 3, separate, but united into one style with a 3-lobed stigma in Bunchosia. Ovules ascending from a broad pendulous funicle, straight or curved; raphe ventral; micropyle superior. Fruit sometimes more or less fleshy (drupe) containing a single 3-celled stone, or 2 or 3 (or 1) separate stones, each with one seed (pyrenes); sometimes more or less dry, either a capsule with each of its 3 segments opening, or each carpel, when ripe, is dry and winged, not splitting open Seed hanging obliquely from below the apex of (samara). the cell.

Species, nearly 600, of which the greater part are natives of Brazil and Guiana, the rest of tropical America, Africa, and Asia, very few being found in warm regions beyond the tropics of N. and S. America and of S. Africa.

§ 1. Erect shrubs or trees. Fruit a drupe. Filaments bearded at the base. Styles free. Drupe with a single 3-celled stone Filaments glabrous. Styles free. Drupe with	1.	Byrsonima.
3 (or 2) crested pyrenes	2.	Malpighia.
Filaments glabrous. Styles united. Drupe with 3 (2-1) smooth pyrenes	3.	Bunchosia.
[§ 2. Erect shrub. Leaves with 2 glands on the margin near the base. Fruit a capsule		Thryallis.
§ 3. Woody trailing climbers, growing over rocks and trees. Fruit: carpels 3(-1), separate, not opening, each with a single dorsal wing or crest.		
Wing thickened on the lower margin	5.	Brachypteris.
opening, laterally winged as well as dorsally winged or crested. Wing 3-lobed, Y-shaped	8.	Tetrapteris.

1. BYRSONIMA L. C. Rich. ex Juss.

Trees or erect shrubs. Leaves without glands; stipules usually united in the axil, persistent. Inflorescence a terminal

raceme in which the flowers are often geminate, the pair sometimes springing from a single pedicel. Calyx persistent, with 10 large sessile glands. Petals yellow, red, or purplish, clawed, blade roundish to kidney-shaped, 4-6 mm. in diam. Filaments hairy at the base, more or less slightly united. Ovary 3-celled; styles 3, distinct; stigmas acute. Drupe with a 3-celled stone; endocarp bony or woody, with sharp angles on the outside. Embryo curled; cotyledons linear, terete.

Species about 100, natives of tropical America, including the West Indies.

Inflorescence tomentose.

Bracts not more than 4 mm. l.

Pedicels of open flower over 8 mm. l. Petals yellow 1. B. coriacea.

Pedicels not over 8 mm. l. Petals rosy-pink.

Leaves leathery, glabrous 2. B. Craigiana.

1. B. coriacea DC. Prodr. i. 580 (1824); leaves variable in shape and in presence or absence of hairs, elliptical, oblongelliptical to lanceolate, or sometimes obovate, apex acute or obtuse or shortly acuminate, base wedge-shaped, papery, glabrous

(Fig. 74.) Specimen from Browne in Herb. Linn.

Locus-berry tree (Browne), Lotus-berry tree (Macfadyen),

Locust tree, Hog-berry tree.

In fl. June-Aug.; Stoane Herb. v. 69 and 92 (in part)! Browne! Wright! Broughton! Shakspear! Bancroft! Port Royal Mts., Macfadyen! also Purdie! Guys Hill, McNab! Wilson! Union Hill, Moneague, Prior! March! J.P. 689, Jennan! J.P. 1291, Bot. Dept.! Green Valley, Port Royal Mts., Bot. Dept.! Berwick; Chesterfield; Lancaster, Portland, 2500-3000 ft.; Mabess R.; Olive R., 3000 ft.; near Troy, 2000 ft.; Harris! Fl. Jam. 5226, 5321, 6328, 7406, 7699, 8411, 8755, 9093.—West Indies, northern S. America.

Tree 10-30 ft. high. Leaves: nerves and veins slightly prominent beneath; petiole tomentellous, 1-1·5 cm. l.; stipules ovate, blunt, 2·5-3 mm. l. Inflorescence 5-9 cm. l. Sepals ovate, somewhat puberulous, about 4 mm. l.; glands about half as long. Petals: blade 4-5 mm. l., claw about as long. Anthers glabrous or with a few hairs. Drupe

globular, about 1 cm. in diam., edible.

2. B. Craigiana Fawc. & Rendle in Journ. Bot. lv. 270 (1917); leaves broadly elliptical or roundish or obovate-elliptical, apex rounded or very obtuse, base rounded or obtuse, leathery, glabrous, 4–7 cm. l., 2–5 · 5 cm. br.; inflorescence brown-tomentose; bracts linear from an ovate base, brown-tomentose or glabrescent, about 3 mm. l.; pedicels 3–8 mm. l.; petals rosy-pink, drying purplish; ovary glabrous.—B. glaberrima Small tom. cit. 167 (1910) (non Niedenzu). Type in Herb. Jam.

In fl. May-July, in fr. Sept.; near Troy, 2000 ft.; Peckham, Clarendon, 2500 ft.; Harris! Fl. Jam. 9411, 10,976, 11,026, 11,042, 12,794, 12,802, 12,806. Tree 15-40 ft. high; young twigs brownish-tomentose. Leaves brownish when dry, young leaves with brownish hairs, adult leaves quite glabrous; lower surface of lighter colour than upper, midrib prominent, nerves not

prominent, somewhat obscure; petiole 3-5 mm. l., canaliculate and glabrescent on the upper side; stipule lanceolate, 5 mm. l. Racemes 3-7(-11) cm. l.; peduncle about 3 cm. l. Sepals 4·5-5 mm. l.; glands about half as long; segments above glands ovate-oblong, puberulous. Petals: blade 4 mm. l., 6 mm. br.; claw 4 mm. l. Filaments 3 mm. l., with few hairs; anthers oblong, glabrous, 1·5 mm. l. Drupe (? mature) globular, 6-7 mm.

This species is named after Mr. Robert Craig, late of Savoy, Clarendon, who has helped by sending specimens for examination and in other ways in connection with the "Flora of Jamaica."

3. B. Smallii Fawc. & Rendle in Journ. Bot. lv. 270 (1917): leaves broadly elliptical, somewhat obovate, apex rounded, base obtuse or rounded, papery, upper surface more or less puberulous. midrib puberulous on both sides, lower surface otherwise glabrous. 3-6 cm. l., 2·2-3·5 cm. br.; inflorescence brown-tomentose; bracts ovate-oblong, glabrous on the inner side, brown-tomentose on the outside, 4 mm. l.; pedicels about 6 mm. l.; petals deep rose-pink when dry; ovary glabrous.—B. Berteroana Small in N. Amer. Fl. xxv. 167 (1910) (non A. Juss.). Types in Herb. Mus. Brit. and in Herb. Jam.

Wild Cashew.

In fl. Aug.; near Troy, 2000 ft., Harris! Fl. Jam. 8763.

Tree 16 ft. high. Leaves: nerves and veins very obscure on upper surface, conspicuously veined beneath, not prominent; petiole 8-11 mm. l., brown-tomentose; stipules ovate, blunt, brown-tomentose, 1·5-2 mm. l. Racemes 4 cm. l.; peduncles 3-4 cm. l. Sepals 4 mm. l.; glands 2 mm. l.; portion above the glands triangular-ovate, obtuse, brown-tomentose. Petals: blade 3-4 mm. 1., 5-7 mm. br.; claw 3-4 mm. 1. Anthers glabrous, about 1.3 mm. l. Drupes not seen.

4. B. bracteata Fawc. & Rendle in Journ. Bot. lv. 269 (1917); leaves elliptical, apex blunt or somewhat rounded, base obtuse or wedge-shaped, papery, glabrous, 7-9 5 cm. l., 3 5-4 5 cm. br.; inflorescence brown-tomentose; bracts foliaceous, narrowly elliptical-oblong, base narrowing and sometimes somewhat stalked, glabrous inside, more or less puberulous or glabrescent on the outside, to 1 cm. l.; pedicels very short; ovary glabrous.

Flowers in bud in Sept.; Peckham, Clarendon, 2500 ft., Harris!

Fl. Jam. 11,202.

Shrub 9 ft. high. Leaves: nerves and veins obscure on upper surface. conspicuously net-veined beneath, not prominent; petiole 6-8 mm. 1., glabrous; stipules ovate, with brownish hairs on the outside, especially on the margin, 3.5 mm. l. Racemes 4-6 cm. l.; peduncles about 2.5 cm. l. Anthers glabrous.

5. B. glaberrima Niedenzu in Arb. Inst. Braunsb., Byrsonima 43 (1901): leaves elliptical, or some ovate or obovate. obtusely acuminate, base obtuse or acute or shortly narrowed, generally unequal-sided, papery and greenish when dry, glabrous, 3.5-6 cm. l., 2-3.5 cm. br.; inflorescence glabrous or with a few silky hairs; bracts oblong or linear-oblong, glabrous, 4-6 mm. l.; pedicels 7-13 mm. l.; petals purplish when dry; ovary glabrous. B. coriacea Small tom. cit. 167 (1910) (non DC.). Type in Herb. Wullschlaegel.

In fr. Sept.; Wullschlaegel; New Green, near Mandeville, 2100 ft. (in fr. only), Harris & Britton! Fl. Jam. 10,595.

Shrub or tree to 30 ft. high, glabrous in all parts, except a few hairs on the inflorescence. Leaves: midrib a little prominent, nerves scarcely prominent; petiole glabrous, 4-8 mm. l.; stipules roundish, 1 mm. l. Racenes 3-6 cm. l., at the end of twigs with several leaves, the leaves at the end minute or bract-like and about 1 cm. from the lowest flowers. Flowers scarcely 1.5 cm. in diam. Sepals ovate, glabrous, apex recurved. about 5 mm. l.; glands slightly more than half as long. Petals: blade 3-4 mm. l., 6 mm. br., claw 4-5 mm. l. Filaments 3 mm. l., with a few hairs; anthers glabrous, 1.5 mm. l. Drupe globular, about 1 cm. in diam.

The description of the flower is from Niedenzu.

2. MALPIGHIA L.

Shrubs or small trees. Leaves without glands, sometimes with stinging hairs, margin entire or sinuate-dentate (in M. cocciqera); stipules minute, deciduous. Flowers in axillary and terminal umbels or corymbs, rarely solitary. Calyx 6-10glandular. Petals red, or purplish, or white; limb roundish. Filaments glabrous. Styles 3, distinct, apex truncate or with a foot-like appendage beyond the stigma. Drupe with the flesh at length drying up, releasing 3 pyrenes, each with 3-5 dorsal

Species 23, natives of the West Indies and tropical continental America.

§ 1. Margin of leaves entire.

Leaves glabrous. Leaves membranous or papery, 2-8 cm. l. Leaves somewhat leathery, 7-12 cm. l. 7. M. Harrisii. Leaves with stinging hairs beneath. Umbels sessile or subsessile. Drupe subglobose. Leaves to 20 cm. l. Drupe to 1.5 cm. in Petals with keel not free at apex 4. M. urens.

Petals with keel to 1 mm. br., free at apex 5. M. incana.

§ 2. Margin of leaves sinuate-dentate with spines 8. M. coccigera.

§ 1. Margin of leaves entire.

1. M. glabra L. Sp. Pl. 425 (1753) & Amæn. v. 379; leaves glabrous, ovate-elliptical to lanceolate, sometimes elliptical, apex

ac ute or acuminate (rarely obtuse), subsessile, 3-8 cm. l.; flowers in 8-3-flowered corymbs or umbels; common peduncle and pedicels somewhat equal in length, 5-15 mm. l.; petals one larger than the rest, 2 smaller than the intermediate; drupe to 1 cm. in diam., pyrenes,* outline oblong- or ovate-elliptical, 3-crested; spaces between the crests with transverse anastomosing ridges; commissural ridge longer than the crests, projecting beyond them at base.—Mill. Gard. Dict. ed. 8 & Ic. t. 181, f. 2; Cav. Diss. 406, t. 234, f. 1; Bot. Mag. t. 813; Macf. Jam. i. 146;

Wright!—Cuba, Hispaniola, Porto Rico, Dominica, Martinique, St.

Lucea, St. Vincent.

Shrub about 3 ft. high. Leaves small, '7-2 cm. l., roundish or roundish-elliptical, teeth large, coarse, spines 1.5-2 mm. l., forming a continuation of the tooth, upper surface shining, with nerves and veins prominent, lower surface with nerves and veins scarcely visible, sessile or subsessile, margin recurved. Flowers solitary, or 2 on a short peduncle, pedicels jointed, 1.5-2 cm. l. Sepals oblong or ovate-oblong, about 3 mm. l.; glands 6, more than half as long. Petals pink, to about 1 cm. l. Drupe somewhat globular, 9 or 10 mm. in diam., red.

3. BUNCHOSIA L. C. Rich. ex Juss.

Leaves usually with 2 glands on the lower surface a little above the base; stipules minute, sometimes united into one. Inflorescence an axillary raceme. Calyx persistent, with 8 to 10 sessile glands (in Jamaican species), about half as long as the calyx. Petals yellow. Filaments glabrous, united at the base. Ovary 2–3-celled; styles united, with a triangular stigma. Drupe, the flesh drying up, releasing the pyrenes; pyrenes 2–3 (rarely 1), without crests.

Species 32, natives of the West Indies and tropical conti-

nental America.

1. B. Swartziana *Griseb. Fl. Br. W. Ind.* 115 (1859); leaves narrowly elliptical to elliptical, occasionally shortly acuminate, tapering to the base, 3–7.5 cm. l.; racemes usually as long as,

or longer than, the leaves; inner petal spathulate, claw margined, the rest with ovate toothed blades; connective yellow, much shorter than the anther-cells; ovary 3-celled.—Niedenzu in Ind. Lect. Lyc. Brunsb., Bunchosia, 4; Small in N. Amer. Fl. xxv. 161. B. media Macf. Jam. i. 149 (1837) (non DC.). Malpighia humilis &c. Browne Hist. Jam. 230? Malpighia nitida Sw. Obs. Naturalized; Watson Hill, Fawcett! Hope estate, 1000 ft., Harris! Fl. Jam. 8394, 11,884.—Central America, naturalized in West Indies.

Leaves narrowly elliptical, glabrous, 2–5 cm. l. Panicles manyflowered; rhachis pubescent with dark-red hairs or glabrescent. Sepals oblong, 3·5-4 mm. l. Petals about 1 cm. l.; blade more or less ovate. Filaments pinkish below, unequal, slightly united at base, 3–5 mm. l.; anthers 3 mm. l. Cocci 3·5 mm. l., dark green. Seeds dark brown, 3 mm. l., radicle prominent.]

4. HETEROPTERIS* H. B. & K.

Shrubs, trailing and twining, climbing over trees (in West Indian species). Leaves, with or without glands on the petiole; stipules inconspicuous. Flowers small, generally in panicles. Calyx usually 8-glandular. Petals yellow, 3-5 mm. in diam. Stamens unequal, all perfect; filaments united at the base. Apex of styles somewhat compressed and dilated, with a sharp point at the back. Samaræ 1-3; the wing dorsal, thickened on the lower margin.

Species about 80, natives of tropical America (including the West Indies), rarely extending beyond the tropics in

S. America, also a few in western tropical Africa.

Leaves leathery, 6-20 cm. l., without glands.

Panicles pyramidal. Fruit, wing elliptical............ 1. H. laurifolia.

Panicles: branches few, patent. Fruit sub-semi-

1. H. laurifolia A. Juss. in Ann. Sc. Nat. sér. 2, xiii. 276 (1840) & Arch. Mus. Par. iii. 458; leaves leathery, glabrous, without glands, 6-17 cm. l.; panicles terminal, pyramidal, branches racemose; wing of fruit elliptical, narrowed near the base, with a triangular projection near the base on the upper margin.—

^{*} Linnæus (Sp. Pl. ed. 2, 611) includes seven species in his genus *Banisteria*. Omitting the East Indian species, of the remaining six three have the lower margin of the samara-wing thickened, and three the upper.

In 1822 Kunth (H. B. & K. Nov. Gen. & Sp. v. 158, 163) applied the name *Banisteria* to species with the upper margin of the wing thickened, and founded a new genus *Heteropteris* for those with the lower margin thickened.

In 1832 Jussieu founded a new genus Stigmaphyllon for species of Banisteria, as defined by Kunth, which have only six perfect stamens instead of ten, thus leaving no species in Linnæus's original enumeration of Sp. Pl. ed. 1 & 2. Strictly speaking Jussieu should have used the name Banisteria for the species which he included under his new genus Stigmaphyllon, i.e., for the portion of Linnæus's original Banisteria left by Kunth, when separating Heteropteris.

Grisebach, Bentham & Hooker, and Niedenzu follow Kunth and Jussieu. Small (N. Amer. Fl.) keeps *Banisteria* for two Linnean species and others with the *lower* margin thickened (giving up *Heteropteris*), and *Stigmaphyllon* for those with the *upper* margin thickened and six perfect stamens.

Near Kingston, Oersted (fide Grisebach).—West Indies, Venezuela, Colombia.

Leaves elliptical, apex and base rounded or obtuse, glabrous, veins reticulate beneath, scarcely visible above; petiole with 2 glands about the middle. Racemes terminal or axillary, corymbose, sparingly pubescent. Bracts and bracteoles minute. Pedicels jointed near the base. Sepals oblong to ovate-oblong, about 2.5 mm. l.; glands 8, 1.5-2 mm. l. Petals purple; blade obovate, base sagittate, 3.5-5 mm. l.; claw 1.5-2.5 mm. l. Fruit striate-veined, sparingly puberulous; wing about 2 cm. l., about 1 cm. br., obliquely obovate-oblong, with a slight projection on the upper margin near the base.

5. BRACHYPTERYS A. Juss.

Sea-shore small shrubs, erect or trailing and twining over low bushes. Leaves with 2 glands on the base of the midrib beneath: stipules very minute. Flowers, in the Jamaican species, in axillary peduncled bracteate umbel-like corymbs. Calyx 8-glandular. Petals yellow, 7-13 mm. in diam. Stamens 10, subequal or unequal. Styles produced into an appendage with the stigmatic surface on the inside. Fruit of 1 to 3 cocci, which bear a short crest at the apex. Embryo: one cotyledon not developing, the other bending over and enveloping it in its growth.

Species 2, natives of West Indies, northern S. America and

central America.

B. ovata Small in N. Amer. Fl. xxv. 138. B. borealis A. Juss. in Ann. Sc. Nat. sér. 2, xiii. 291 (1840) & Arch. Mus. Par. iii. 356, t. ii. f. 16. Griseb. Fl. Bras. xii. 35 & Fl. Br. W. Ind. 117; Hemsl. in Biol. Cent. Am. Bot. t. 151. Banisteria ovata Cav. Diss. 429, t. 257, f. 1 (1790). Stigmatophyllon ovatum Niedenzu in Ind. Lect. Lyc. Brunsb., Stigmatophyllum, pt. 2, 31 (1900); Urb. Symb. Ant. iv. 331. (Fig. 78.) Specimens of Rohr & Aublet from Guiana, and of Smeathman from Ins. Carib. named by A. Juss. are in Her's. Mus. Brit.

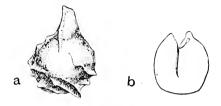

Fig. 78.—*Brachypteris ovata* Small.

a, A coccus, nat. size.
b, Embryo enlarged (after A. de Jussieu).

In salt marshes on the seaside, Macfadyen! near Annotto Bay; Port Maria; McNab! Wilson.—West Indies, northern S. America, Central America.

Shrub 1-4 ft. Leaves ovate to lanceolate, apex acute or somewhat obtuse, base rounded, glabrous above, pubescent with soft short hairs bereath, midrib prominent beneath and with 2 glands on it at the base, 5-11 cm. l.; petiole 1-1·5 cm. l.; bracts roundish-ovate or round, 1-3·5 cm. l. Umbels 3-4-flowered, pedicels 1·5-3 cm. l.; peduncle 3·5-6 cm. l. Sepals scarcely exceeding the glands by 1 mm.; glands oblong, 2·5-3 mm. l. Petals: limb crenulate, base wedge-shaped, 7-13 mm. in diam.; claw 2-4 mm. l. Styles 3, equal, the appendage hook-like. Cocci somewhat spherical, 10-13 mm. in diam., outer surface with irregular prominent markings; apical crest triangular, 3-5 mm. l. or more.

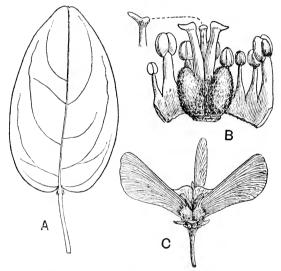

6. STIGMAPHYLLON A. Juss.

Trailing twining shrubs, climbing over shrubs and trees. Leaves often silky beneath with hairs attached by their middle, with 2 glands at apex of stalk or base of midrib; stipules minute. Flowers in peduncled umbel-like corymbs. Calyx with 8 glands. Petals yellow, 5–12 mm. in diam. Stamens unequal, 6 perfect, 4 not properly developed. Styles 3, truncate at apex or more or less angled, or produced beyond the stigma into a foot-like or expanded appendage. Samaræ 1–3, with the wing thickened on the upper margin. Cotyledons often unequal, with the larger enfolding the smaller.

Species about 50, natives of tropical America, including the

West Indies.

1. S. emarginatum A. Juss. in Ann. Sc. Nat. sér. 2, xiii. 290 (1840) & Arch. Mus. Par. iii. 382; leaves of various forms and sizes, but, in Jamaican species, usually broadly elliptical, ovate, or roundish, sometimes lanceolate, apex generally emarginate and apiculate, base cordate to emarginate, or rounded, or truncate, silky especially beneath, becoming more or less glabrate, usually

 $\label{eq:fig.79.} \begin{array}{ll} \text{Fig. 79.--Stigmaphyllon emarginatum A. Juss.} \\ \text{A, Leaf, nat. size.} & \text{B, Stamens and pistil} \times 4. \\ \text{C, Fruit, nat. size.} \end{array}$

membranous or papery in younger branches, often subleathery in older branches; anterior style (the one opposite the glandless sepal) curved, shorter and slenderer than the two posterior, its apex usually growing into an appendage above the stigma continuous with the style; apex of the posterior styles truncate and more or less angled or foot-like; Griseb. Fl. Br. W. Ind. 118; Niedenzu in Ind. Lect. Lyc. Brunsb., Stigmaphyllon, pt. 1, 5; Small in Fl. N. Amer. xxv. 140. S. periplocæfolium A. Juss. in Ann. Sc. Nat. sér. 2, xiii. 290 (1840) & Arch. Mus. Par. iii. 380; Griseb. op. cit. 119; Niedenzu tom. cit. 7. S. diversifolium A. Juss. (in part) in Ann. Sc. Nat. sér. 2, xiii. 290 (1840) & Arch.

Mus. Par. iii. 381. S. lingulatum Small loc. cit. (1910). Acer scandens minus, apocyni facie, folio subrotundo Sloane Cat. 138 & Hist. ii. 27, t. 167, f. 2. Banisteria foliis orbiculatis &c. Browne Hist. Jam. 231. Banisteria fulgens L. Sp. Pl. 427 (1753) (non S. fulgens A. Juss. 1840). B. emarginata Cav. Diss. 425. t. 249 (1790). Triopteris lingulatum *Poir. in Lam. Encyc. viii.* 104 (1808). B. periplocefolia *DC. Prodr. i.* 589 (1824). B. splendens *Macf. Jam. i.* 152 (1837) (non *DC.*). (Fig. 79.) Specimen from Hort. Cliff. in Herb. Mus. Brit., also one from Browne in Herb. Linn, named by Linnaus Banisteria fulgens.

Sloane Herb. v. 94, 95, 96! Houstoun! Browne! Wright! Shakspear! Macfadyen! Distin! St. Mary, McNab! Purdie! Wilson! Prior! March! Hope Grounds, J.P. 1009; King's House grounds, J.P. 1309; Morris! Lucea, Hitchcock; Gordon Town, 1100 ft.; sea-coast near Falmouth; Papine 800 ft.; Spanish Town road, 100 ft.; Fort Henderson; Green Island, Fish river; Montego Bay; near Old Harbour Bay; Harris! Fl. Jam. 5706, 7236, 8368, 8524, 9232, 10,148, 10,258, 10,350, 11,947.—West Indies from Cuba to St. Lucia.

Leaves 1-14 cm. l., '5-9 cm. br. Peduncles and pedicels pubescent with adpressed hairs or glabrescent. Sepals ovate or roundish ovate, exceeding the glands by 2-3 mm.; glands elliptical or roundish ovate, 1.5-2 mm. l. Petals 8-12 mm. in diam.; claw 2-4 mm. l. Samaræ: pericarp ribbed lengthwise and somewhat reticulately, 4-6 mm. l.; wing obliquely obovate-oblong, 16-20 mm. l., 6-9 mm. br.; appendage at base of wing triangular, rounded, or somewhat 4-sided, 2-3 mm. l.

Intermediate forms between S. emarginatum and S. periplocæfolium occur in Jamaica, as Niedenzu has pointed out; we think that these forms, and those occurring in the other islands, which have been known as S. periplocæfolium, should all be regarded as one species.

The Hort. Cliff. specimen, and one collected by Distin in Jamaica in Herb. Kew., are considered by A. Jussieu to belong to his species S. diversifolium, but we do not think that these specimens can be separated from

S. emarginatum.

We have seen in Herb. Smith at the Linnean Society the leaf which Cavanilles sent for comparison with the specimen named Banisteria fulgens by Linnæus (see Cav. Diss. 127), and as Smith pointed out it is different. It is unfortunate that Smith's answer was delayed so long that Cavanilles' plate was engraved with the name B. fulgens, and Cavanilles felt himself compelled to put the name which Lamarck had given in error into circulation. Jussieu followed Cavanilles, and in transferring the species to Stigmaphyllon, called it S. fulgens. As this name has been so long in use, another S. fulgens cannot now displace it.

2. S. puberum A. Juss. in Ann. Sc. Nat. sér. 2, xiii. 289 (1840) & Arch. Mus. Par. iii. 376; leaves ovate-elliptical, usually long acuminate, base subcordate or rounded or obtuse, membranous, glabrous above, silky pubescent beneath; anterior style longer than the posterior, apex growing out into an expansion separated from the stigma by a short stalk, irregularly 4-sided; apex of the posterior styles growing into a falcate-acute expansion; Griseb. loc. cit.; Niedenzu op. cit. pt. 2, 22; Urb. Symb. Ant. iv. 331; Small tom. cit. 144. Banisteria pubera L. C. Rich. in Act. Soc. Hist. Nat. Par. i. 109 (1792).

"St. Mary"; "near Annotto Bay, St. George"; McNab!—West Indies,

Panama and northern South America.

Leaves 7-15 cm. l., 3·5-10 cm. br., floral leaves on an axillary branch, often lanceolate or bract-like, petioles silky with adpressed hairs 4-1·5 cm. l. Sepals ovate or somewhat obovate-oblong, exceeding the glands by 1·5-2 mm.; glands elliptical 1-1·5 mm. l. Petals with fringed margin; limb 5-8 mm. in diam.; claw 2-3 mm. l. Samarn oblong to oblong-lanceolate; wing to 3·5 cm. l., at the base to 1·5 cm. br.

7. TRIOPTERIS L.

Climbing shrubs. Leaves without stipules. Racemes or panicles axillary and terminal. Glands of the calyx 8. Petals pink or purplish. Stamens all perfect. Ovary 3-lobed, lobes 3-crested, and with a small lobe below the median crest. Samaræ 3, crested on the back, 3-winged; the lateral wings erect, united with the third inferior into a deeply 3-lobed, Y-shaped wing. Embryo folded on itself.

Species 3 or 4, natives of the West Indies and the Bahamas.

1. T. paniculata Small in N. Amer. Fl. axv. 124 (1910); leaves ovate, ovate-lanceolate, lanceolate, or rarely elliptical, apex obtuse or acute, base rounded or subcordate; panicle somewhat corymb-like.—T. jamaicensis Sw. Obs. Bot. 183 (1791); Macf. Jam. i. 150 (non L.); A. Juss. in Arch. Mus. Par. iii. 516 under T. ovata Cav.; Griseb. Fl. Br. W. Ind. 120. Banisteria seminibus trialatis &c. Browne Hist. Jam. 231. Malpighia paniculata Mill. Gard. Dict. ed. 8 (1768). (Fig. 80.) The type, Miller's specimen, is in Herb. Mus. Brit. A specimen from

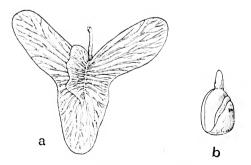

Fig. 80.—Triopteris paniculata Small.

a, Samara × 2.
b, Embryo enlarged (after A. de Jussieu).

Browne is in Herb. Linn. named Banisteria benghalensis by Linnæus.

Sloane Herb. v. 92! Houstoun! Browne! Wright! Broughton! Shak-spear! Swartz; Macfadyen! Wilson! March! Watson's Hill, Manchester, 800 ft.; near Letitz, 500 ft.; Pedro Bluff; Harris! Fl. Jam. 6380, 7263, 9989.

Leaves reticulate-veined, 3-10 cm. l., 1.7-3.7 cm. br. Sepals 3-3.5 mm. l. Petals pink or light purplish, to 5 or 6 mm. l.; blades broadly roundish or kidney-shaped, with undulate margin. Samaræ 14-24 mm. l.; upper wings oblong, the lower one oblong, or oblong-lanceolate, or narrowly

elliptical; crest subrhomboid with sinuate-eroded margin.

T. ovata Cav. from Hispaniola, with which the Jamaican species has been confused, differs in having smaller flowers, and the crest of the samara being ovate-triangular. T. jamaicensis L. is the species from Cuba and the Bahamas, with oblong-elliptical leaves, 2-3 cm. l.; it has not been found in Jamaica.

2. T. Brittonii Small in N. Amer. Fl. xxv. 124 (1910); leaves ovate, usually broadly so, markedly acuminate, base cordate; panicle pyramidal.

Spur Tree Hill, Britton, 1069. Type in Herb. N. York Bot. Gard. of which a small portion has been presented to Herb. Mus. Brit. by Dr.

N. L. Britton!

Leaves reticulate-veined, 4-10 cm. l. Sepals ovate, about 2 mm. l.; glands about 1·5 mm. l. Petals purplish, to 4·5 or 5 mm. l.; blades roundish, undulate and sometimes irregularly toothed. Samaræ not known.

8. TETRAPTERIS Cav.

Woody climbers, trailing over rocks and trees. Leaves without glands; stipules inconspicuous. Umbels or racemes generally paniculate, terminal. Calyx usually 8-glandular. Petals yellow. Filaments united below. Ovary 3-lobed, lobes crested on the back and with 2 appendages on each side. Apex of styles slightly enlarged. Samaræ 1–3, crested on the back, with 4 lateral wings placed X-like, 2 above and 2 below. Embryo folded on itself.

Species over 60, natives of tropical continental America

(chiefly Brazil), and the West Indies.

T. citrifolia Pers. Syn. i. 508 (1805) (excl. syn.); Macf. Jam. i. 151 (excl. syn. Cav.); Urb. Symb. Ant. iv. 328 (in part); Small in N. Amer. Fl. xxv. 125; A. Juss. in Arch. Mus. Par. iii. 522 & Griseb. Fl. Br. W. Ind. 121 under T. inæqualis Cav. Banisteria foliis ovatis obpositis &c. Plum. Pl. Amer. (Burm.) 9, t. 16. Triapteris citrifolia Sw. Prodr. 75 (1788) & Fl. Ind. Occ. 857. T. bifurca Gærtn. Frnct. ii. 168, t. 116 (1791). (Fig. 81.) There is a specimen from Swartz in Herb. Mus. Brit.

Mountain woods, Swartz! between Halberstadt and Galloway House. Macfadyen; St. Mary, McNab! Purdie! Wilson!—Hispaniola.

Leaves elliptical or oblong-elliptical, apex acute, blunt, or shortly acuminate, glabrous, base rounded, obtuse or wedge-shaped, 5-13(-17) cm. l.; glands wanting. Inflorescence: branches and pedicels white at first with short adpressed hairs, then glabrate; bracts at base of main branches, leaf-like. Sepals broadly ovate to oblong-ovate, exceeding the glands by 1-1.5 mm.; glands oblong, 2-2.5 mm. l. Petals elliptical to roundish, 4-6 mm.l., margin undulate, base hastate; claws about 3 mm.l.

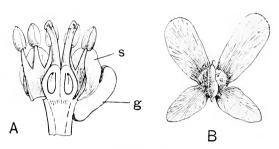

Fig. 81.—Tetrapteris citrifolia Pers. A, Flower cut lengthwise, corolla removed; s, sepal; g, gland \times 6. B, Samara, nat. size.

Filaments lanceolate or awl-shaped. Samaræ: upper wings oblong or obovate-oblong puberulous at the base, 13-16 mm. l.; lower wings slightly puberulous, 9-10 mm. l.; body somewhat densely puberulous, with a wing-like crest on the back.

T. inequalis Cav. which is found in Hispaniola, Porto Rico, Martinique, and St. Vincent, differs from this species in some characters, especially in

the dorsal crest being a mere ridge.

9. MASCAGNIA Bert.

Shrubs, trailing and climbing (in the Jamaican species). Stipules minute, at the base of the petiole, deciduous; glands near the top of the petiole. Inflorescence axillary and terminal racemes, often paniculate; pedicels jointed about the middle. Calyx: sepals 5, broad, persistent; glands 10 or 8. Petals 5, entire or fringed. Stamens 10, all perfect. Ovary 3-lobed, lobes obscurely 3-crested on the back; styles 3, distinct, unequal, apex foot-like. Samaræ 1–3, each with a membranous crest on the back and winged at each margin; wings obversely deltoid or semicircular. Cotyledons leafy, nearly equal.

Species 40, natives of tropical America (incl. West Indies).

M. Hiræa comb. nov.—M. jamaicensis Urb. & Niedenzu in Arb. Inst. Braunsb., Mascagnia 24 (1908); Small in N. Amer. Fl. xxv. 119. M. Simsiana Griseb. Fl. Br. W. roundish, 4 similar with entire margin and base retuse or somewhat toothed, the fifth with a fringe (1-2 mm. 1.) all round, 7-11 mm. 1.; claw 3 mm. 1. Stamens unequal. Samaræ glabrate: crest about 8 mm. deep, 2-3 mm. br.; wings obversely deltoid, to 2 cm. deep and br., outer margin irregular.

FAMILY L. POLYGALACEÆ.

Herbs, or shrubs often climbing, or trees. Leaves generally alternate, simple, without stipules. Flowers in spikes or racemes, hermaphrodite, irregular. Sepals 5, imbricate, the 2 innermost larger, petaloid, wing-like ("wings"), all persistent round the fruit (in *Polygala*). Petals 3 or 5, the large petal concave, enclosing the stamens and pistil ("keel"), 2 nearly as long as the keel, 2 (in W. Indian species) wanting or very small and scale-like. Stamens 8; filaments united into a cleft sheath and adhering more or less to the petals at the base; anthers some-

what broadly tubular, 2-celled, each cell with an oblique opening at the apex. Ovary 2-celled (1 cell sometimes abortive). Ovules solitary, pendulous, anatropous, with a ventral raphe. Fruit a 2-celled loculicidal capsule, or a dry 1-celled winged fruit, not opening. Seeds with, or without endosperm. Embryo straight.

Species 800, dispersed through the temperate and warmer

regions of the whole world.

1. POLYGALA L.

Herbs, shrubs, or trees. Petals 2, more or less adhering to the staminal tube and the keel. Anthers 1- or 2-celled opening by a transverse foramen or inwards by an oblique one. Ovary 2-celled. Capsule opening loculicidally at the margin.

Species 600 or more, natives of temperate and warmer regions

of the whole world.

Flower with crested keel. Herb...... 1. P. paniculata. Keel without crest.

1. P. paniculata L. Syst. ed. 10, 1154 (1759) & Amæn. v. 381, 402; slender annual herb, 5-12 inches (1·3-3 dm.), and more, high; stem and leaves densely covered with minute glands, sometimes glandular-puberulous; racemes terminal and lateral, loosely-flowered; keel crested.—Sw. Obs. Bot. 272, t. 6, f. 2; H. B. & K. Nov. Gen. & Sp. v. 402; Bot. Reg. t. 761; Macf. Jam. i. 47; Griseb. Fl. Br. W. Ind. 28; A. W. Bennett in Fl. Bras. xiii. pt. 3, 31, t. 11, f. 2; Chod. in Mém. 8039, 8240, 8992, 8999, 10,326, 11,140, 11,838.

Shrub with numerous branches trailing over neighbouring shrubs and low trees to a height of 25-40 ft. Leaves elliptical, rounded at apex, obtuse or wedge-shaped at base, minutely puberulous or glabrous, 5-4 cm. l., becoming gradually smaller (to 1 cm. l.) near the flowers. Racemes 4-S cm. l. Sepals 4-3 mm. l., elliptical to roundish, coloured, densely puberulous on the outside, minutely ciliate, with parallel dark veins. Wings large, semicircular or rounded, unequal-sided, minutely ciliate, \(\frac{1}{2}\)-form. br. and nearly as long, with a very short claw. Petals oblong, contracted in the middle, oblique and rounded above, gibbous at base, about 6 mm. l.; lateral scale-like, oblong, about 1 mm. l. Keel: blade about 8 mm. l., as folded together 3 mm. br., narrowly elliptical along the edge of the fold, somewhat straight along the free margin, truncate at base; central portion of apex folded together with an irregular margin. Staminal sheath villous along the margin, about as long as the petals; free filaments about 2 mm. l. Ovary compressed-ellipsoidal, margined on both sides, margin on one side passing into the style just below the apex, on the other slightly enlarged and forming a very short appendage above the ovary; style excentric, bent like a hook; stigma with 2 capitate lobes. Fruit: seed-case about 1 cm. l., and as broad or nearly so, marked with a few branching lines, sometimes not prominent; wing somewhat oblong, 3-4 cm. l., 2-1 5 cm. br. near apex, 9-10 mm. br. at base.

2. S. erecta Jacq. Eaum. Pl. Carib. 27 (1760); racemes lax, anterior margin of seed-case very narrow, of the same breadth

throughout, without any projection.—Jacq. Sel. Stirp. Amer. 197, t. 183, f. 39 & Ed. pict. t. 261, f. 56; L. Sp. Pl. ed. 2, 992. S. volubilis L. Syst. ed. 10, 1155 (1759) (non Sp. Pl. 707). S. foliis orbiculatis &c. Plum. Pl. Amer. (Burm.) 245, t. 248, f. 1. S. fruticosa foliis subrotundis &c. Browne Hist. Jam. 287. A specimen from Swartz from Hispaniola in Herb. Mus. Brit. (Fig. 84, B-G.)

St. James, Browne; mountains, St. James, Tussac; Macfadyen!-

Cuba, Hispaniola, Porto Rico.

Shrub with numerous slender flexible branches, supporting themselves on neighbouring shrubs and low trees and often reaching to their summits. Leaves elliptical or round, sometimes ovate-roundish, generally more or less emarginate, 2-1.5 cm. l. on the lower branches, becoming smaller to ·5 cm. l. on the flowering branches. Racemes numerous at ends of branches, to 1.5 dm. l. Flowers smelling of violets. Sepals ovate to roundish-ovate, 2-3 mm. l., puberulous on the outside and margin, some-Wings unequal-sided, roundish or somewhat triangular, what veiny. 8 mm. l. and br., minutely ciliate; claw about 1·3 mm. l. Petals oborate above, oblong below, much curved and concave, about 5 mm. l.; upper portion 2·5 mm. br.; base with a sinus, so that there appears to be 2 claws; lateral lanceolate, about 6 mm. l. Keel: blade about 6 mm. l. (as folded together), 4 mm. br., edge of the fold curved outwards elliptically, free margin slightly concave, truncate at the base; middle portion of the apex forming a large, expanded, irregularly toothed crest, about 2 mm. l.; claw 2 mm. l. Staminal sheath about 6 mm. l.; free filaments 3-4 mm. l.; with a small abortive stamen at the back. Ovary compressed-ellipsoidal, about 1 mm. l., very shortly stalked, margined on one side; appendage on the other side triangular-conical, free part above ovary generally '8 mm. l. Fruit: seed-case 7-9 mm. l., 4·5-6 mm. br., reticulate with prominent lines; wing narrowly elliptical, or with an elliptic curve on anterior side and somewhat straight on posterior side, 2.5-3 cm. l., 10-12 mm. br. above, gradually narrowing to 4-6 mm. br. at base, extending down $\frac{1}{3}-\frac{1}{2}$ the posterior side of seed-case; seed-case and base of wing minutely puberulous, rest of wing glabrescent.

Jacquin founded his species on Browne's description on p. 287 of the "Natural History of Jamaica." The specimen of S. volubilis L. Sp. Pl. 707 in the Linnean herbarium is Nissolia fruticosa Jacq., and the citation from Plumier, Sparteum citri foliis, floribus albis &c., confirms our view that Linneaus was not dealing with any species of the genus Securidaca as understood by Jacquin and other botanists. The S. volubilis of the Systema ed. 10, refers to Browne's description, but in the second edition of "Species Plantarum" (992) the name is given up,

and Jacquin's name substituted.

3. S. Lamarckii Griseb. Fl. Br. W. Ind. 30 (1859); inflorescence paniculate, often very long with distant branches, lax-flowered; anterior margin of seed-case narrow below, broad above, apex 2-toothed, about 4 mm. above seed-case.—S. scandens Lam. Encyc. rii. 51 (1806) (excl. syn.) (non. L.) & Illustr. t. 599, f. 1.

Macfadyen (fide Grisebach). — St. Cruz (introduced), Martinique, St. Vincent.

Shrub with numerous flexible branches, bending at the tip, forming large open hooks for support. Leaves elliptical, apex obtuse or subemarginate, base obtuse or rounded, 3.5-7 cm. l., generally much smaller. about 1.5 cm. l. on the inflorescence; veins densely reticulated and prominent on both sides, upper surface glabrous or minutely puberulous at base, beneath minutely tomentose or puberulous. Inflorescence to 5 dm. l. and more. Sepals puberulous on the outside towards the base, ciliolate, two elliptical, narrowed on the lower half of one side, about 3 mm. l.: the third elliptical, concave, 4 mm. l. Wings about 9 mm. l., about 6 mm. br., unequal-sided, broadly elliptical, one side somewhat straight, wedgeshaped at the base forming a claw 3 mm. l. Petals broadly obovate above. oblong below, much curved and concave, about 7.5 mm. l. upper portion 2.5-3 mm. br.; lateral linear-lanceolate, 1 mm. l. Keel: blade ciliolate, 7-8 mm. l. (as folded together), 4-5 mm. br., somewhat ovate; apex forming an ample folded minutely toothed crest, about 1 mm. l.; claw 5 mm. l. Staminal sheath about 7 mm. l.; free filaments about 2 mm.l. Ovary about 1.2 mm. l., shortly stalked, margined on one side, appendage on the other side ovate, acute, produced beyond the ovary about 8 mm. 1.; style about 1 cm. l. Fruit: seed-case 6 mm. l., 5-6 mm. br. (incl. margin), reticulate with prominent lines in the upper part, with a prominent nerve from the base; wing oblong-elliptical, about 4 cm. l., about 1.4 cm. br., with apex rounded from the anterior margin, narrowing on the posterior margin to form a stalk-like part 5-7 mm. 1., 2-3 mm. br., not extending down the posterior side of seed-case.

This species is included on the authority of Grisebach, but we have not seen a specimen from Jamaica. Dr. O. Paulsen informs us that "it was introduced into St. Cruz in the 18th century and is now quite naturalized." Grisebach includes Cuba in the distribution, but the Cuban plant repre-

sents, we think, a different species.

FAMILY LI. EUPHORBIACEÆ.

Trees or shrubs or sometimes herbs, with sap often milky, occasionally poisonous. Leaves usually alternate, sometimes opposite or whorled, entire or toothed, sometimes digitately lobed, or with 3 or more digitate leaflets, or reduced to scales. Stipules often present, small, soon falling or persistent, rarely large, and sometimes enclosing the bud. Flowers unisexual, monecious or diecious, regular or slightly irregular. Perianth often small, sometimes wanting, sometimes dissimilar in the male and female flowers, either a calyx only, or calyx and corolla. Male flowers: Receptacle sometimes expanded into a disk within the stamens, or the glands or lobes of the disk alternating with the stamens of the outer series. Stamens sometimes indefinite in number, sometimes as many as the sepals or petals or fewer, or reduced to one. Filaments free or more or less united. Rudiment of ovary present or absent. Female flowers: Disk hypogynous, ring-like, lobed or cup-shaped, or represented by distinct glands, or wanting. Ovary usually 3-celled; styles as many as cells of ovary. Ovules 1 or 2 collateral in each cell, descending, anatropous, attached at the central angle of the cells; rhaphe ventral; funicle expanded

very often into a cushion-like outgrowth (obturator). Fruit usually capsular, splitting into as many cocci as there are ovarycells, the axis persisting, each coccus opening above and along the back by 2 valves—sometimes drupaceous, divided into cells, not splitting. Seeds generally as many as the ovules, often with a caruncle at the apex. Endosperm usually copious, fleshy, rarely scanty or wanting. Embryo central, straight or slightly curved, generally as long as the endosperm; cotyledons flat, broad; radicle superior; rarely when the endosperm is scanty or wanting, the cotyledons are fleshy, large, and folded.

Species about 4,000, widely distributed over the world,

mainly in the tropics.

Tribe I. Phyllantheæ. Perianth single, the calyx (rudimentary petals in Savia). Stamens opposite the sepals, or (in Phyllanthus) in centre of flower. Ovules 2 in each cell. Inflorescence axillary. (See also Tetrorchidium in Tribe Crotoneæ.)

Tribe II. Picrodendroneæ. Perianth wanting in male flower; single, the calyx, in female flower. Stamens indefinite in number, subtended by bracts. Ovary 2-celled, ovules 2 in each cell.

6. Picrodendron.

Tribe III. **Crotoneæ. Perianth single, the calyx, or double, calyx and petals. Stamens in one or more series, the outer alternate with the sepals, or in the centre of the flower (opposite the sepals in *Tetrorchidium**). Ovules 1 in each cell.

Perianth double, calyx and petals (petals small in Acidocroton and Argythannia, usually small or wanting in female flowers of Croton).

Inflorescence racemose or spicate.

Inflorescence terminal 7. Croton.

Inflorescence axillary.

Tribe IV. Euphorbieæ. Involucre enclosing several male flowers, and one female flower, simulating an hermaphrodite flower; the male flower consisting of a single stamen. jointed to a pedicel, with or without a minute scale at the joint; the female flower consisting of an ovary on a pedicel, with or without 3 minute scales. Ovary 3-celled, ovules solitary in each cell.

1. PHYLLANTHUS L.

Herbs, shrubs, or trees. Leaves entire, alternate (very rarely opposite), in two vertical rows, well developed, or small or scalelike; petiole either wanting or very short, to one-tenth the length of the blade, but in P. glabellus long, one-third to one-half the length of the blade. Flowers generally monecious (diecious in

P. nobilis), small, in clusters in the axils or at the nodes of leafless branches, or on modified flowering branches which are flattened or leaf-like, notched, with the flowers at the notches, without petals, male generally numerous, female few or solitary in the same axil or on a different branch. Male flowers: Sepals 5, 6, or 4, imbricate in two series, all similar or the outer shorter, herbaceous or subpetaloid. Disk of six separate glands. Stamens 2, 3, 4, or 5 in the centre of the flower. No rudimentary ovary. Female flowers: Sepals like those of the male. Disk saucershaped or cup-shaped, of separate glands in P. latifolius. Ovary 3-celled (12-6-celled in P. reticulatus). Styles wanting or developed, free or united more or less in lower half, 2-branched, 2-lobed, or cut into many segments. Ovules two in each cell. Capsule splitting up into 2-valved cocci. Seeds 3-sided, usually attached below the top, without a caruncle.

Species nearly 600, mostly in the tropics and sub-tropics,

rarer in temperate regions.

A. Leaves well developed; flowering branches not flattened nor leaf-like. Petiole, either wanting or very short, to one-tenth the length of the blade. Sepals in both sexes 5 or 6. Stamens 3. Pétioles 1-3 mm. l. Stipules ovate-lanceolate, 1·5-3 mm. l., deciduous. Flowers red, solitary or 2-5 in clusters, or racemose, or panicle-like on slender branches from which the leaves have dropped; pedicels 1-3 cm. l. Male flowers: Disk of 5-6 glands. Female flowers: Disk saucer-shaped, crenate. Capsule globular, 9-10 mm. in diam., slightly fleshy on the outside. Seeds 1-2 in each cell, pointed at apex, flattened at the other

end, 5-7 mm. l.

2. P. acuminatus Vall Symb. ii. 95 (1791); shrub or much branched tree, 8-25 ft. high; twigs green, more or less puberulous, angular; leaves 2-4·5 cm. l., ovate, acuminate or shortly acuminate, glabrous, but sometimes puberulous on nerves, margin, and petiole; sepals of male flower about 1 mm. l., 3 outer deltoid, about 2 mm. br., 3 inner ovate, about ·5 mm. br., of female flower about 1·5 mm. l., 3 outer broadly ovate, 3 inner oblong-ovate; filaments united into a column; anthers 3, horizontal from apex of short column; styles free, 2-branched, reflexed.—Baill. Adans. i. 33 & ii. 15; Muell. Arg. in DC. Prodr. xv. pt. 2, 381. P. Conami Sw. Prodr. 28 (1788) & Fl. Ind. Occ. 1105.

Wright! Hartweg (fide Baillon); near Castleton, Harris! Fl. Jam. 8409, 11,147.—Cuba, Martinique, St. Vincent, Trinidad, tropical conti-

nental America.

Petiole 3-4 mm. l. Stipules linear-lanceolate, 1·5-2 mm. l. Flowers numerous, one female, the rest male, in axillary clusters. Male flowers: Pedicels about 3 mm. l., several together. Disk of 3 glands. Female flowers: Pedicels about 13 mm. l., one in each cluster, thickened and angled at apex. Disk of 3 large bigibbous glands united laterally to form a cup. Capsule 3·5-4 mm. l., surface net-veined. Seeds about 2·5 mm. l., reddish-brown, keeled on the back.

3. P. portoricensis Urb. Symb. Ant. iv. 388 (1910); shrub 12 ft. high, glabrous; leaves 3-6 cm. l., obovate, base cuneate; flowers diœcious (?); sepals of female flower 5 or 6, obovate to ovate, about 1 mm. l.; styles free, 2-5-lobed, spreading.—Diasperus portoricensis Kuntze Rev. Gen. Pl. ii. 602 (1891). A specimen from Kuntze in Herb. Kew.

Hope grounds, 700 ft. *Harris*! Fl. Jam. 12,193, 12,344, 12,398.—Porto Rico.

Petiole 5-10 mm. l. Male flowers not known. Female flowers greenish-yellow, several together in axillary clusters; pedicels 2-4 mm. l. Sepals:

outer obovate, inner ovate. Disk saucer-shaped with undulate margin. Fruit globular, 6-7 mm. in diam., outer coat fleshy, milky-white, enclosing 3 cocci. Seeds 3-cornered, 2 mm. l., somewhat reddish-brown, smooth.

4. P. Fadyenii Urb. Symb. Ant. vi. 13 (1909); shrub, glabrous; leaves 4–5 mm. l., upper elliptical or shortly ovate, leathery, apex rounded, generally obsoletely apiculate, base emarginate, the lower roundish; sepals of male flower 5, 1·2 mm. l., roundish, of female flower 5, 2 mm. l. (in fruit); filaments 3, free; anthers opening longitudinally.—P. orbicularis Griseb. Fl. Br. W. Ind. 34 (1859) (as regards the Jamaican plant) (non H. B. & K.). Type in Herb. Kew.

Macfadyen!

Stipules linear-awl-shaped, persistent, 1.5-5 mm. l. Flowers in the axils, generally solitary. Pedicels of male flower about 1 mm. l., of female to 3.5 mm. l. Disk of 5 glands. Female flowers: Sepals obovate.

[P. Urinaria L. Sp. Pl. 982 (1753); an erect or procumbent annual herb (occasionally perennial), 4–16 inches (and more) high; stem and branches minutely hispid at the angles; leaves ·5–2 cm. l., oblong, sensitive, tip rounded or apiculate, margin often minutely hispid; flowers subsessile; sepals of male flowers 6, about ·5 mm. l., of female flowers 6, about ·7 mm. l., oblong, 1-nerved; filaments united into a column; anthers 3, erect, united, opening vertically; styles free; seeds transversely wrinkled.— Muell. P. foliis pinnatis floriferis, floribus sessilibus caule herbaceo procumbente L. Fl. Zeyl. 157. Type in Herb. Hermann in Herb. Mus. Brit.

Naturalized; Hope river valley; Hope grounds; Castleton grounds; Bath; Harris! Fl. Jam. 9980, 12,082, 12,142, 12,155, 12,195.—Tropical

Asia, Australia, Pacific Is., rare in Africa.

Stipules lanceolate-acuminate from a peltate base. Flowers greenish, minute, solitary in the axils, males in the uppermost part of the branch. Male flowers: Scpals obovate-elliptical. Disk composed of separate minute glands. Female flowers: Scpals persistent, reflexed in fruit. Disk saucer-shaped, margin irregularly toothed. Ovary, surface densely granulate. Styles short, 2-cleft. Capsule about 2 mm. in diam., depressed-globular, sometimes with minute spines on the surface. Seeds about 1.3 mm. l.]

5. P. carolinensis Walt. Fl. Carol. 228 (1788); herb, becoming woody below, 2-11 inches high, glabrous; branches spreading, or stiff and erect; leaves 6-11(-20) mm. l., membranous, obovate or oblong-obovate, apex rounded or blunt; sepals of male flower 6, about ·5 mm. l., obovate-roundish, of female flower 6, ·5-1 mm. l., increasing to about 1 or 1 ·5 mm. in fruit, linear-oblanceolate;

filaments 3, free; styles free, 2-branched, horizontal.—Michx. Fl. Bor. Am. ii. 209; Muell. Arg. in DC. Prodr. xv. pt. 2, 399. P. obovatus Muchlenb. ex Willd. Sp. Pl. ed. 4, iv. 574 (1805): A. Rich. in Sagra Cub. xi. 215.

Belle Vue, near Spanish Town; Castleton grounds, 500 ft., Harris! Fl. Jam. 12,046, 12,143.—Cuba, Hispaniola, Martinique, northern S. America,

Central America and northwards to Pennsylvania.

Petiole scarcely 1 mm. l. Stipules about '5 mm. l., triangular, acute, scarious at tip and margin. Flowers a few, subsessile in axils, male and female. Pedicels '5-1 mm. l. Disk of male flowers composed of distinct glands; of female flowers saucer-shaped. Capsule globular-depressed, nearly 2 mm. in diam. Seeds 3-cornered, minutely papillose (under a strong lens), about 1 mm. l.

6. P. niruri L. Sp. Pl. 981 (1753); annual herb, 6 inches-2 ft. high, glaucous; flowering branches angular to 1 dm. l.; leaves 1-1.8 cm. l. in the middle of the twig, shorter above and below, oblong-elliptical or oblong-obovate, rounded to blunt at both ends, membranous, glabrous; pedicels 1-2 mm. l.; sepals 5-6, unequal: of male flowers '5-8 mm. l., ovate, of female about 1 mm. l., elliptical-ovate; filaments united into a column; anthers 3, distinct; styles free, very short, each with two very short branches.—Wight Ic. t. 1894; Griseb. Fl. Br. W. Ind. 34; Muell. Arg. in DC. Prodr. xv. pt. 2, 406 & in Fl. Bras. xi. pt. 2, 53; Hook. f. Fl. Brit. Ind. v. 298; Watt Econ. Prodr.; Urb. Symb. Ant. iv. 338; Hutchinson in Fl. Trop. Afr. vi. pt. 1, 731. P. foliis...pedunculatis &c. L. Fl. Zeyl. 157. Urinaria indica &c. Burm. Zeyl. 230, t. 93, f. 2. Type in Herb. Linn.

Macfadyen! Distin! Arnott! Kingston, Prior! Port Antonio, Millspaugh; Kingston, Hitchcock; Porus, C. G. Lloyd; King's House grounds, T. J. Harris! Hope grounds, 700 ft.; Harris! Fl. Jam. 6675, 6773, 6855, 12,136.

—Widely spread in the Tropics, naturalized in Bermuda.

Petiole about 1 mm. l.; stipules lanceolate-awl-shaped, scarcely 1 mm. l. Flowers clustered 2 together, 1 male and 1 female, or each solitary, in axils of leaves. Male flowers: Disk of separate glands. Female flowers: Disk saucer-shaped, with 5-6 lobes. Capsule depressed-globular, 2-2·3 mm. in diam. Seeds with 5 to 6 lines along the back, about 1 mm. 1.

The root is a remedy for jaundice; half an ounce of the fresh root is rubbed in a cup of milk, and given night and morning. An infusion of the tender roots is valuable in chronic dysentery. The properties of P. Urinaria

are identical with those of this species. (Watt)

7. P. aquaticus C. Wright in Sauvalle Fl. Cub. 124 (1868); erect herb, to 2½ ft. high, sometimes procumbent at base, growing amongst sedges and coarse grasses in boggy ground; stem spongy with a loose bladder-like epidermis at base when growing in water: leaves 4-5 mm. l., elliptical, with rounded apex, subsessile; sepals of male flower 5, 1 mm. l., obovate-roundish, of female flower 5, 1.5 mm. l., elliptical; filaments united into a staminal column: anthers 3, distinct, opening horizontally; styles 2-branched.

Hollis's Savanna, Clarendon, 2400 ft.; Cornwall, St. Elizabeth; Harris!

Fl. Jam. 12,224, 12,555.—Cuba.

Stipules triangular, acuminate, about 1 mm. l. Flowers solitary in axils, or 2 or 3 together, male and female mixed; pedicels about 1 mm. l. Male flowers: Disk of 5 separate glands. Anthers sessile at apex of column. Female flowers: Disk saucer-shaped with wavy or shortly-lobed margin. Styles 3, each with two short branches. Capsule (not seen) depressed, with the sepals persistent, generally becoming larger (fide Wright). Seeds (not seen) longitudinally striate, with numerous transverse lines (fide Wright).

[P. reticulatus Poir. Encyc. v. 298 (1804); shrub or small bushy tree, 6-10 ft. high; leaves 2-3·5 cm. l., elliptical or oblong-elliptical, glabrous; sepals of male flower 5 or 6, 2-2·5 mm. l., outer elliptical, inner obovate, of female flowers 5-6 (4-7), 2-2·5 mm. l., outer elliptical, inner obovate or roundish; filaments 3 (or 2) inner more or less united, fleshy, 2 (or 3) outer short, slender or abortive with the anthers sessile at the base of the other filaments; anthers erect, opening vertically; styles wanting, branches minute, 2-lobed.—Muell. Arg. in DC. Prodr. xv. pt. 2, 344. Hook. f. Fl. Brit. Ind. v. 288. P. jamaicensis Griseb. Fl. Br. W. Ind. 34. Anisonema reticulatum A. Juss. Euph. Tent. t. 4, f. 11 (1824). A. multiflorum Wight Ic. t. 1899 (1852).

Naturalized; Macfadyen! Woods above Bath, Purdie! Wilson! Plantain Garden River, Harris & Britton! cult. Castleton Garden! Fl. Jam. 10,677.

—East Indies, Malaya, China, Tropical Africa.

Petiole 2-3 mm. l. Stipules triangular. Flowers axillary, 5-2 in a cluster, one female, the rest male. Pedicels slender, unequal, 3-4 times as long as the petiole. Disk of minute glands. Ovary globular, 12-6-celled; styles wanting; stigmas minute, 2-lobed. Capsule leathery or fleshy, subgranulate, 2-3 mm. in diam. Seeds 8-16, irregularly 3-cornered, granulate, punctulate.]

8. P. minor Fawc. & Rendle in Journ. Bot. lvii. 65 (1919); herb, woody below, $1\frac{1}{2}$ -2 ft. high, glabrous; leaves 6-15(-19) mm. l., 4-8 mm. br., lateral nerves 2-4 on each side; sepals 5, ·6 mm. l., of male roundish, of female flower ovate, sometimes as long as ·9 mm. in fruit, with a greenish midrib; filaments free; anthers rounded, opening laterally; styles free, slender, 2-branched to about the middle, spreading or reflexed.—P. nummulariæfolius Britton in Journ. Torr. Bot. Club xliv. 36 (1917), (non Poir.). Type in Herb. Jam.

Hope grounds, 700 ft., Harris! Fl. Jam. 12,123, 12,157, 12,208.

Leaves obovate-elliptical, apex blunt or rounded, base cuneate, thinly membranous; petiole 1 mm. l.; stipules awl-shaped, 1 mm. l. Flowers solitary or clustered in axils; pedicels slender, shorter than the leaf, 4-5 mm. l. Male flowers: Disk of 5 shortly obovate, truncate glands. Stamens 5. Female flowers: Disk saucer-shaped, entire. Capsule depressed-globular, 2 mm. in diam. Seeds 3-angled, semi-circular on back, light brown colour, minutely and closely papillose, 8 mm. l.

9. P. eladanthus Muell. Arg. in Linnea, xxxii. 46 (1863) & in DC. Prodr. xv. pt. 2, 413; slender tree, 21–30 ft. high; trunk at base not more than 1 dm. in diam. tapering to 2.5 cm. at apex; branches 3 or 4 at intervals, erect; leafy branchlets several crowded together at apex of trunk and branches; leaves about 1 dm. l., about 4 cm. br.; flowers in racemes or panicles, 2–5 together from small knobs on the main trunk and sometimes on the branches; sepals of male flower 4 (or 5), unequal, 1–2 mm. l.; anthers 3–4, united at the apex, diverging towards the base; sepals of female flower 5; ovary oblong-ovoid; stigmas sessile, broad, spreading, reflexed.—P. cauliflorus Griseb. Fl. Br. W. Ind. 33 (1859) (in part). Type in Herb. Kew.

Wilson! near Troy, 2500 ft., Harris! John Crow (Blake) Mts., eastern slopes of south end, Harris & Britton! Fl. Jam. 8722, 8761, 10,727.

Leaves ovate-elliptical, acuminate; stipules broadly triangular, thick, persistent, about 4 mm. l. and br. Pedicels several in clusters along the rhachis. Glands of male flower concave upwards, with irregular fleshy margin. Staminal column thick; sepals of female flower fleshy, elliptical to ovate, blunt. Glands of female flower small, linear-oblong in outline.

10. P. cauliflorus *Griseb. Fl. Br. W. Ind.* 33 (1859) (in part); Muell. Arg. in Linnæa xxxii. 46 (1863) & in DC. Prodr. xv. pt. 2, 412; tree about 20 ft. high; trunk 5 cm. in diam., bearing branches from the apex (like Comocladia or Spathelia) and the racemes below; branches simple, 1.5-3 dm. l., angled but not flattened; leaves 8-13 cm. l., 3-5 cm. br.; flowers in racemes or panicles which spring 2-3 together from small scaly knobs on the main trunk; sepals of male flower 4, subequal, about 1.5 mm. l., yellowish-green; anthers 2, united at apex of column, diverging obliquely below; sepals of female flower 5, unequal, 1·2-1·7 mm. l.; ovary cylindrical-ellipsoidal, the base 3-celled, the upper portion elongating to form a stout column after fertilization; stigmas sessile, flat, broadly triangular, with prominent lateral angles.—Omphalea cauliflora Sw. Prodr. 95 (1788). Epistylium cauliflorum Św. Fl. Ind. Occ. 1099, t. 22, fig. e, f, h (1798). Omphalea Epistylium Poir. Encyc. Suppl. iv. 140 (1816) (in part). A specimen from Swartz named by him in Herb. Stockholm, and one in Herb. Mus. Brit.

Mts. in west, Swartz!

Leaves elliptical to oblong, acute or acuminate; petiole about 5 mm. l.; stipules broadly triangular, thick, persistent, 2 mm. br., 1·5 mm. l. Racemes 6-15 cm. l. Pedicels 12-20, about 3 mm. l. in clusters on minute tubercles. Glands of male flower fleshy, grooved along the upper face. Staminal column about half as long as the calyx. Sepats of female flower elliptical-oblong to ovate, fleshy, blood-red, persistent. Capsule (fide Swartz) oblong, obtusely 3-cornered, attenuated at the apex; seeds 2 in each cell.

11. P. axillaris Muell. Arg. in DC. Prodr. av. pt. 2, 412 (1866); shrub 2-4 ft. high; branches flattened towards the

apex; leaves 7-12 cm. l., 3-5 cm. br., ovate or ovate-lanceolate, acuminate; racemes in axils 1.2-2.5 cm. l.; sepals of male flowers 4, sub-equal, yellowish-green; anthers 2, united at apex of column, diverging obliquely below; sepals of female flower 5, green, 3 larger roundish-ovate to 1.2 mm. l., smaller elliptical-oblong; ovary ellipsoidal; stigmas sessile, triangular, closely reflexed. Omphalea axillaris Sw. Prodr. 95 (1788). Epistylium axillare Sw. Fl. Ind. Occ. 1097, t. 22, fig. a-d, g (1798); A. Juss. Euphorb. Tent. t. 3, fig. 8. Phyllanthus Epistylium Griseb. Fl. Br. W. Ind. 33 (1859). A specimen from Swartz named by him in Herb. Stockholm, and one in Herb. Mus. Brit.

Mts. in west, Swartz!

Petiole 2-3 mm. 1. Stipules broadly triangular, acute or acuminate, leathery, persistent. Flowers: Male 4-8 in a cluster; pedicels 4-8 mm. 1.; glands 4, broadly concave upwards; female generally solitary in the clusters; pedicel about 2 mm. l.; glands minute, oblong. Capsule broadly ellipsoidal, obtuse (fide Muell.). Secds 1 in each cell.

[P. distichus Muell. Arg. in DC. Prodr. xv. pt. 2, 413 (1866); tree 20-30 ft. high; older branches about as thick as a finger, from which the leaves have dropped, leaving large prominent scars; younger branchlets slender, leafy, deciduous; leaves 3-7.5 cm. l., ovate, acute, base somewhat oblique; flowers reddish, monœcious, minute, densely clustered; clusters axillary on leafy branches with long-stalked flowers, or on slender rhachises of the inflorescence springing several together at the axils of the scars of fallen leaves with short-stalked flowers: sepals of male flower scarcely 1 mm. l., obovate to roundish, of female flower about 1:2 mm. l., elliptical, persistent; filaments 4, free; anthers opening longitudinally; ovary 4-(3)-celled; styles 4, free, reflexed; fruit 1.5 cm. in diam.—Muell. Arg. in Fl. Bras. xi. pt. 2, 68; Hook. f. in Fl. Brit. Ind. v. 304; Urb. Symb. Ant. iv. 339; Watt Dict. Econ. Prodr. Ind.; Bailey Cyclop. Amer. Hort. fig. 1771. P. longifolius Jacq. Hort. Schoenbr. ii. 36, t. 194 (1797). Cicca disticha L. Mant. 124 (1767); Lam. Illustr. t. 757, f. 1: A. Juss. Euphorb. Tent. t. 4, f. 13, A; Griseb. Fl. Br. W. Ind. 32; Rheede Hort. Mal. iii. t. 47, 48.

Otaheite Gooseberry. In gardens; Hope Gardens, Harris!—Warmer regions of the world. Stipules narrowly triangular, acuminate, about 1 mm. l. Disk of male flowers of 4 free glands, of female narrowly saucer-shaped. Fruit: Pericarp fleshy, acid, when dry 6-8-lobed and splitting up into 3 or 4 cocci.

The fruits are not unlike gooseberries, but acid and astringent; they are eaten raw or dressed in various ways, pickled or made into preserves.

The roots and seeds are purgative. (Watt)]

12. P. nobilis Muell. Arg. in DC. Prodr. xv. pt. 2, 414 (1866); tree 20-40 ft. high; leaves 4-13 cm. l., narrowly elliptical or oblong-elliptical, acute to subacuminate at both ends; flowers diecious, male clustered, female solitary in the axils of leaves; sepals 4 in 2 series, elliptical or roundish, of male 1·5 mm. l., of female 2 mm. l.; filaments 4, free; anthers opening longitudinally; ovary 5-4-celled (rarely 3-celled); styles united below, 5-3, 2-lobed or 2-cleft or variously divided; fruit barely 1 cm. in diam.—Muell. Arg. in Fl. Bras. xi. pt. 2, 69; Urb. Symb. Ant. iv. 339. Euonymus margaritifera &c. Pluk. Phyt. t. 176, f. 4. Margaritaria nobilis L. f. Suppl. 428 (1781) (excl. male plant). Cicca antillana A. Juss. Euphorb. Tent. t. 4, f. 13 B (1824); Griseb. op. cit.

Bastard Hog Berry.

Troy 1600-2200 ft.; Harris! Fl. Jam, 8698, 9450, 9490.—West Indies,

tropical S. America, Panama.

Stipules triangular, acuminate, 3-4 mm. l., entire. Disk of both sexes entire, of the male adhering to the sepals below, of female narrow, ringlike. Fruit: Pericarp at first fleshy, at length drying up and dividing into 5-3 cocci, depressed-globular. Seeds somewhat plano-convex to 3-sided, smooth, greenish-brown, 3 mm. in diam.

13. P. glabellus Fawc. & Rendle in Journ. Bot. lvii. 68 (1919); petiole long, $\frac{1}{3}-\frac{1}{2}$ the length of the blade. P. tremulus Griseb. Fl. Br. W. Ind. 34 (1859): Muell. Arg. in DC. Prodr. xv. pt. 2, 330. Croton glabellum L. Amen. v. 383, 409, & Sp. Pl. ed. 2, 1425 (excl. syn. Sloane & Browne).

Browne! Wright! Purdie! Wullschlaegel; Round Hill, Santa Cruz Mts., 1£00 ft.; Malvern to Mountainside, 400 ft.; Harris! Fl. Jam. 9707,

9903.—Type from Browne in Herb. Linn.

Shrub or small tree 6-15 ft. high. Leaves 3-9·5 cm. l., broadly elliptical, conspicuously lighter-coloured beneath, glabrous; stipules lanceolate-linear, '5 cm. l., deciduous. Male flowers minute, clustered, lateral; pedicels slender, 9-11 mm. l. Sepals 10, in two series, the outer elliptical-oblong, 1·5 mm. l., the inner oblong-lanceolate, larger, to 2·5 mm. l. Disk saucer-shaped, crenate, '6 mm. l. Filaments united into a short column, about '5 mm. l. Anthers 4, close together, attached round the margin of the peltate connective, opening transversely. Female flowers: Pedicels solitary or a few together, about as long as those of the male, increasing in fruit to 3·5-4·5 cm. l. Sepals 10, the two series very unequal; outer series broadly oblong, ultimately 2 mm. l., inner series thin, linear-oblong, ultimately 3·5 mm. l. Disk cup-like, margin wavy or lobed, '5 mm. l. Style-branches sessile on apex, 2-lobed, fleshy. Capsules at first somewhat fleshy, depressed-globular, 8-10 mm. in diam. Seeds 6-3, often all abortive, flattish ellipsoidal, buff-coloured, smooth, 4·5 cm. l.

B. Flowering branches flattened, generally leaf-like, of firm leathery texture, notched, with the flowers clustered in the notches. Branches ("penultimate branches") that bear the flowering branches, in *P. epiphyllanthus* normal, woody and rounded; in *P. montanus* slightly modified; in the rest similar in substance to the flowering branches, and more or less flattened and linear. The penultimate

branches of P. epiphyllanthus and P. montanus are permanent branches, growing on from the scaly apex at the next growing season; in other Jamaican species the penultimate branches are deciduous and the normal branches alone have the scaly apex continuing the growth. Normal leaves almost invariably wanting, but represented by scales, accompanied by stipules, at apex of branches, on edges of very young flowering branches, and at base of flowering and penultimate branches, both scale-leaves and stipules very deciduous.

- a. Flowering branches spirally scattered; penultimate branches normal, persistent.
- 14. P. epiphyllanthus L. Sp. Pl. 981 (1753); Muell. Arg. in DC. Prodr. av. pt. 2, 428; Urb. Symb. Ant. iv. 339. P. falcatus Sw. Fl. Ind. Occ. 1115 (1800); Griseb. Fl. Br. W. Ind. 35; Pluk. Phyt. t. 247, f. 4. Phylanthos americana &c. Commel. Amst. i. 199, t. 102; Catesb. Carol. ii. t. 26. Xylophylla falcata Sw. Prodr. 28 (1788); Bot. Reg. t. 373. X. epiphyllanthus Britton in Ann. Miss. Bot. Gard. ii. 42 (1915). (Fig. 85.) Specimen named by Swartz in Herb. Mus. Brit. There are specimens of this species in Plukenet's Herbarium in Herb. Sloane without definite localities; see xcvii. 100, ci. 106, ccxxxii. 27.

Seaside Laurel, Rock Bush, Soap Plant, Sword Bush. Purdie!—Bahamas, West Indies.

Shrub 2-15 ft. high, glabrous. Scaly cone at apex of branches and penultimate branches scarcely broader than branch. Scale-leaves 1.5-2.5(-4) mm. l., very broadly to narrowly triangular, more or less persistent at base of flowering branches; stipules rudimentary. Flowering branches generally strap-shaped or linear, sword-shaped to sickle-shaped, sometimes more or less lanceolate or oblanceolate, 6-14 cm. l., 10-16 (2-23) mm. br., striate with veins close together, 7-11-notched on each side, notches truncate. *Male flowers*: *Pedicels* slender, 1-3 mm. l. *Sepals* blood-red, 1-1.5 mm. l., outer oblong-elliptical, smaller than the broadly elliptical inner. Disk of 6 glands. Staminal column with 3 very short branches at apex. Anthers opening horizontally. Female flowers: Pedicels thick, 1-2 mm. l. Sepals like the malc. Disk saucer-shaped. Styles united below, free parts flattened, much divided and recurved at apex. Capsule depressed-globular, 3-furrowed, 4.5-5 mm. in diam.

Soap is sometimes made from the ashes of the plant. A decoction is used as a gargle for sore throat. A poultice made from the plant is applied

successfully to open sores and foul ulcers.

- b. Flowering branches in 2 vertical rows; penultimate branches slightly modified, persistent.
- 15. P. montanus Sw. Fl. Ind. Occ. 1117 (1800); staminal column entire; styles 3, recurved, closely adpressed, 2-3-branched or lobed.—Muell. Arg. tom. cit. 429; Grisch. loc. cit. Xylophylla montana Sw. Prodr. 28 (1788) & Ic. ined. t. 35. X. latifolia

Sw. Prodr. 28 (1788). Specimen from Swartz in Herb. Mus. Brit., also one named by him in Herb. Stockholm.

On limestone rocks in the west, Swartz! Pedro district, St. Ann, Purdic! Cascade of Falls R. near Kingston, Prior! near Troy, 2000 ft.; Holly Mount, Mt. Diablo, 2700 ft.; Dolphin Head, 1600 ft.; Fray Woods, 1650-1800 ft.; Peckham, Clarendon, 2500 ft.; Harris! Fl. Jam.

8736, 8986, 9251, 10,338, 10,991, 11,013, 12,797.

Slrub or tree 5-25 ft. high. Scaly cone at apex of branches and penultimate branches scarcely as broad as upper part of branch. Scale leaves and stipules minute, 1-1.5 mm. l., deltoid, very deciduous. Flowering branches varying much in size and form, lanceolate to oblong or elliptical, 5-15 cm. l., 1-4 cm. br., outline wavy, notched almost through their whole length; notches usually indistinct, shallow; veins oblique, close together. Normal leaves occasionally occurring, elliptical, 7-10 mm. l., on branches very slightly expanded or broad like the flowering branches. Flowers many in a cluster, 4-12 male, 1 female. Pedicels 2 mm. l. to shorter than the calyx. Male flowers: Sepals 5(4), pale red, 1-1.2 mm. l., more or less unequal, broadly elliptical, somewhat leathery. Disk of fleshy glands somewhat concave at apex. Anthers 3, sessile, cells united at back, opening horizontally. Female flowers: Sepals 5, dark purple, somewhat leathery, roundish or ovate-roundish, unequal, 1-1.2 mm. l. Disk of 5 separate flat elliptical glands. Capsule globular, 4 mm. in diam. Seeds light brown, 2 mm. l.

- c. Flowering branches in 2 vertical rows; penultimate branches modified, deciduous.
- 16. P. angustifolius Sw. Fl. Ind. Occ. 1111 (1800); pedicels 2-3 mm. l.; sepals 1-1·5 mm. l.; filaments united usually above the middle, free above; anther-cells separate; styles 3 or 4, united at the base, recurved, cut halfway into 2-4 narrow branches, and often subdivided.—Griseb. loc. cit.; Muell. Arg. tom. cit. 430 (incl. vars.). Phyllanthus foliis angustis &c. Browne Hist. Jam. 188 (?). Xylophylla angustifolia Sw. Prodr. 28 (1788) & Ic. ined. t. 36; Lodd. Bot. Cab. t. 577. X. elongata Jacq. Specimen apparently from Browne in Herb. Linn. named Phyllanthus Epiphyllanthus in Solander's hand.

Barham in Herb. Sloane clxii. 285! Broughton! stony and rocky places in the west, Swartz! Macfadyen! Distin! Yallahs R., Purdie! Lane! Lucea, Hitchcock; Sheldon, Blue Mts.; near Hagley Gap, 1600 ft.; near Cinchona; Yardley Chase, 1600 ft.; near lighthouse, Negril; Orange Bay Point, Hanover; Harris! Fl. Jam. 5830, 8592, 9666, 10,233, 10,262.—Cuba.

Shrub, 2-10 ft. high. Bark of young twigs reddish-brown, becoming ash-coloured. Scaly cone up to three times as broad as the upper portion of twig, somewhat globular. Scale leaves linear, acuminate, about 3 mm. l.; stipules broadly triangular, acute or blunt, about 3 mm. l., ciliate with rusty-red pubescence. Penuitimate branches usually 6-11 cm. l., 1-5-2 mm. br., apical flowering branches generally paired; sometimes (var.

elongatus) the terminal portion becomes (especially in cultivated specimens) much elongated (to 2 dm. 1) and broader than below (to 3.5 mm. br.), bearing flowers. Flowering branches lanceolate, linear-lanceolate, strap-shaped but narrowed to both ends, to oblanceolate, straight or slightly curved, with blunt or acuminate apex, usually 9-5 cm. 1., 11-4 mm. br.; notches 5-7(-9) on each side, distant, few below the middle, truncate, with conspicuous cushions; veins irregularly unequal, close together. Pedicels 2-4. Sepals 6, outer elliptical with brownish apex, about 1 mm. 1., inner rhomboid or broadly-elliptical, about 1.3(-1.5) mm. 1. Disk of male flower, of 6 subsessile, roundish, concave glands; of female flower saucer-shaped, 6-lobed, the lobes often irregular, rarely scarcely united below. Capsule globular, 4-4.5 mm. in diam.

After an examination of a fragment of the type of Xylophylla contorta Britton (Bull. Torr. Bot. Club, xxxvii. 353 (1910)) kindly sent by Dr. Britton, we are unable in the absence of flowers to separate it from the

above species.

17. P. latifolius Sw. Fl. Ind. Occ. 1109 (1800); pedicels 2 mm. l. to shorter than sepals; sepals 5-1 mm. l.; filaments 3 (2-1), united to middle or beyond, free above; anthers united at the back; disk of female flower of minute separate glands; styles 3, united in lower half, free above, erect, branches 2-3(-5) cleft, recurved.—Griseb. loc. cit. P. isolepis Urb. Symb. Ant. iii. 290 (1902); Pluk. Phyt. t. 36, f. 7. Lonchitidi affinis &c. (including the variety) Sloane Hist. i. 80. P. foliis latioribus &c. Browne Hist. Jam. 188. Xylophylla latifolia L. Mant. 221 (1771); Sw. Prodr. 28 (1788) & Obs. Bot. 113 (1791). Specimen named by Swartz in Herb. Mus. Brit. Specimen apparently from Browne in Herb. Linn. named Phyllanthus Epiphyllanthus in Solander's hand.

Sloane Herb. i. 62! Liguanea, Barham in Herb. Sloane clxii. 285! Shakspear! Masson! McNab! Healthshire Hills, Purdie! March! Port Antonio, Hitchcock; Ferry Pen, 150 ft., Campbell! Long Mountain, west, 800 ft; Cane R. valley, 250-400 ft.; Harris! Healthshire Hills, Harris & Britton! Fl. Jam. 6280, 8843 (8845, 9334, 9339 without flowers), 9631, 10,065, 10,523. Fl. Jam. 10,523 matches a specimen from Masson named Xylophylla latifolia by Swartz in Herb. Mus. Brit. McNab's specimen in Herb. Edinburgh is named P. latifolius in Grisebach's handwriting.

Shrub or small tree to 10 or 12 ft. high. Bark ash-coloured, soon becoming roughish, with conspicuous scars. Scaly cone at apex of branches broader than branch. Scale leaves and stipules narrowly triangular, acuminate, or linear-acuminate on young twigs, 3-8 mm. 1. Penultimate branches slightly notched, 1-2 dm. 1, 1·5-2 mm. br. Flowering branches in two vertical rows, rhomboid, rhomboid-lanceolate, or oblanceolate, generally acuminate at both ends, 5-8 (3·5-8·5) cm. 1, 1-2·5 cm. br.; notches 10-16(-19) on each side, generally above the middle, dense, with prominent cushions formed by bracteoles of several flowers, striated by the principal, somewhat distant veins. Flowers red, several, sometimes numerous. Male flowers: Sepals 6 (or 5), unequal, outer generally linear-oblong to obovate, apex brownish, '5-'7 mm. 1, inner obovate or subrhomboid, '8-1 mm. 1. Disk of 6 shortly stalked glands. Sepals of female flowers like those of male. Capsule globular, base truncate or slightly hollowed, brownish, 2·5-3 mm. in diam., 2 mm. 1. Secds about 1·7 mm. 1., brownish.

18. P. speciosus Jacq. Collect. ii. 360 (1788) & Ic. Pl. Rar. t. 616; pedicels about 6 mm. l., in fruit to 1 cm. l.; sepals 1.5-1.7 mm. l. (in the female flower increasing in the fruit); filaments 3, united halfway from the base, free above, diverging; connective of anthers diverging, cells separate, opening horizontally; styles short, spreading, 2-3-divided, branches recurved. —Sw. Fl. Ind. Occ. 1107 (1800); Griseb. loc. cit.; Muell. Arg. tom. cit. 431. P. arbuscula Steud. Nomencl. ed. 2 (1841). Xylophylla arbuscula Sw. Prodr. 28 (1788) & Ic. Ined. t. 34. X. latifolia Bot. Mag. t. 1021 (1807) (non L.). Specimens from Swartz in Herb, Mus. Brit, and in Herb, Stockholm.

Broughton! "Catherine Hill," Swartz! Bancroft! March! John Crow Mt., 4000 ft., J.P. 1263, Hart! Silver Hill, Bot. Dept.! near Troy, 2000-2500 ft.; Harris! Fl. Jam. 8565, 8714, 8771, 9368.

Shrub or small tree, 6-20 ft. high. Scaly cone at apex of branch large, much broader than branch; scale-leaves and stipules lanceolate to linear, acuminate, 4-8 mm. 1. Penultimate branches 1-3 dm. 1., 1·5-2 mm. br. Flowering branches in two vertical rows, broadly lanceolate, acuminate, slightly curved or straight, 4-7 cm. 1., usually 1-2 cm. br.; notches 10-14 on each side, indistinct, with cushions small, at length more developed, with larger cushions, striated only by the principal, somewhat distant veins. Pedicels 3-6 from each cushion. Male flowers pale red or white. Sepals 5 or 6, elliptical-ovate or oblong, outer with brownish apex. Disk glands 5 or 6, somewhat concave, very shortly stalked. Female flowers blood-red. Sepals 5 or 6, roundish-elliptical or rhomboid-elliptical, outer with brownish apex, green (Swartz). Disk saucer-shaped, margin wavy or 6-lobed, '3 mm. l., about one-fourth to one-third the length of the ovary. Capsule depressed-globular, 3-furrowed, about 5 mm. l. Seeds ovoid, brownish, about 3.5 mm. l.

The specimens from Troy have shorter ovate blunt scales, about

3 mm. l., and distinct notches.

19. P. inæqualiflorus Fawc. & Rendle in Journ. Bot. lvii. 66 (1919); pedicels 3-5 mm. l.; sepals of male flower 2 mm. l., of female nearly 3 mm. l.; stamens less than half as long as sepals; filaments united nearly to apex, column about . 5 mm. l.; anthercells separate; ovary one-third the length of sepals; styles united, ·5 mm. l., column erect, one-half as long as the ovary, branches 3, short, broad, spreading, divided below the middle into two or three linear segments, recurved; disk of male flowers of stalked large flat roundish peltate glands, as long as the staminal column, of female flower saucer-shaped with lobed margin, 3 mm. l., onethird as long as ovary. Types in Herb. Mus. Brit. and Herb. Jam.

Holly Mount, Mt. Diablo, Harris! Fl. Jam. 8988.

Shrub or tree to 20 ft. high. Scaly cone (young) at apex of branches, scales triangular, acute or acuminate, about 3 mm. l. Penultimate branches 6-12 cm. l., 1-1.5 mm. br. Flowering branches in two vertical rows, lanceolate to narrowly oblong, apex obtuse, 4-5 cm.l.; notches few, 5-8 on each side, above the middle, small or indistinct; striated only by the principal somewhat distant veins. Pedicels 1-4 at each notch. Sepals of male flower 6, ovate-elliptical, of female flower obovate-oblong or elliptical to roundish.

20. P. Coxianus Fawc. & Rendle in Journ. Bot. lvii. 66 (1919): pedicels 3-6 mm. l.; sepals 1·4-2·2 mm. l.; stamens half as long as sepals; filaments united above the middle, column ·6-1 mm. l.; anther-cells united; disk of female flower cup-shaped, about half the length of the ovary; ovary about one-third the length of the sepals; styles united into a short erect column, one-third to onequarter length of ovary, branches much longer than column, divided halfway into two or three spreading linear segments or main branch again forked.

In a garden, St. Ann, Prior! Ramble, Claremont, 1700 ft., Fawcett & Harris! Fl. Jam. 7025.

Shrub, 10 ft. high. Bark of young shoots light brown, becoming ashcoloured and roughish with conspicuous scars. Scaly cone about twice as broad as the twig; stipules triangular-ovate, blunt; scale-leaves linearlanceolate, acuminate, both 3-4 mm. l. Penultimate branches 8-17 cm. l., 1-2 mm. br. Flowering branches in two vertical rows, elliptical, narrowing to both ends, with apex generally subacuminate, or lanceolate or oblanceolate, 6-9 cm. l., 1.5-2 cm. br.; notches 14-7 on each side, mostly above the middle and somewhat dense, sometimes one or two occurring below the middle, distinct; striated only by the principal, somewhat distant, veins. *Pedicels* 1-4 at each notch. *Male flowers*: *Sepals* 6, unequal, elliptical or obovate-elliptical, outer about 1.4 mm. l., inner to 2.2 mm. l. Female flowers: Sepals 6, unequal, outer elliptical about 1.5 mm.l., inner broadly obovate-elliptical or roundish, about 2 mm.l.

This species is named in honour of the late Hon. H. E. Cox, owner of

the estate on which it was found.

21. P. Swartzii Fawc. & Rendle in Journ. Bot. lvii. 67 (1919): pedicels 6-7 mm. l.; calyx obconical, narrowing gradually into the pedicel; sepals 1.7 mm. l.; stamens nearly equalling sepals; filaments long, united almost to apex; anther-cells separate; ovary together with styles nearly equalling sepals; styles united, as long as the ovary, stigmas sessile on the column, 2-3-divided, recurved or spreading; disk of male flowers of flattened roundish peltate glands, of female flower cup-shaped with lobed margin, as long as the ovary.—P. latifolius Muell. Arg. in DC. Prodr. xv. pt. 2, 431 (1866); Urb. Symb. Ant. iii. 291 in Obs. (non Sw.). Specimens from Swartz in Herb. Mus. Brit. and Herb. Stockholm.

Sea-coast, Swartz! Lapland, 2000 ft., Harris! Fl. Jam. 9191.

Tree 15 ft. high. Scales at apex of branches ovate, apex blunt or acute, 3-5 mm. 1.; stipules at base of flowering branches more or less deciduous, lanceolate or linear; scaly cone two or three times as broad as upper part of branch. Penultimate branches modified, slightly notched, linear, compressed, about 1 dm. l., 1·2-2 mm. br. Flowering branches in two vertical rows, lanceolate, acuminate, 4-6·5 cm. l., 1-1·5 cm. br.; notches distinct, 8-12 on each side, extending below the middle; striated only by the principal somewhat distant veins. Pedicels 1 or 2(-4) at each notch. Flowers red, 2 mm.l. Male flowers: Scpals 6, subequal, elliptical. Disk: glands 6, flattened, roundish, peltate. Filaments 7 mm.l. Female flowers: Scpals as in male.

22. P. linearis Sw. Fl. Ind. Occ. 1113 (1800); flowering branches linear, similar to the penultimate branches and scarcely wider.—Griseb. loc. cit.; Muell. Arg. tom. cit. 430. Xylophylla angustifolia, var. linearis Sw. Prodr. 28 (1788).

Wright! Swartz; Bertero; Macfadyen! sea coast, Westmoreland, Purdie! Cinnamon Hill, Shore! Lucea, Hitchcock; Mulgrave, St. Elizabeth, 1300 ft.; Eton, Hanover, 100 ft.; Harris! Fl. Jam. 12,382, 12,871.

Shrub 1-10 ft. high. Stipules triangular-ovate, about 1.5 mm. 1. Penultimate branches 6-8 cm. 1., 1.5-2 mm. br. Flowering branches in two vertical rows, 3-10 cm. 1., 1-3 mm. br.; notches 2-5 on each side, distant, minute; veins dense, straight. Male flowers: Sepals 6, roundish, white, about 1 mm. 1. Disk of 6 flat, roundish glands. Filaments united below into a very short column, free above. Anther-cells united, opening horizontally. Female flowers: Sepals 6, outer oblong with brownish tips, scarcely 1 mm. 1., inner elliptical or ovate, 1.2 mm. 1. Disk saucer-shaped, splitting irregularly into broad segments, about one-third the length of the ovary. Styles flattened, recurved, triangular-obovate, truncate, with minute lobes at apex.

The plant commonly grown in gardens under the name *Phyllanthus nivosus* W. G. Smith, and to some extent naturalized, is **Breynia nivosa** Small (Bull. Torr. Bot. Cl. xxxvii. 516 (1910)), a native of New Hebrides. It is a bushy shrub of loose habit, with dark, wiry branches, and white and green mottled, ovate-elliptical leaves. Flowers monœcious, the male with a short top-shaped calyx, the female with a campanulate calyx which becomes enlarged and spreading in the fruit.

2. SECURINEGA Juss.

Shrubs. Twigs in S. Acidoton and some other species spiny at apex. Leaves alternate, entire (small, clustered in S. Acidoton), somewhat leathery. Flowers clustered in the axils, monœcious or diœcious, without petals; male small, numerous, subsessile, female fewer or solitary. Male flowers: Sepals 5, imbricate. Lobes of the disk or glands 5, alternate with the stamens. Stamens 5, opposite the sepals. Ovary rudimentary with three style-like branches. Female flowers: Calyx like that of the male. Disk subentire. Ovary 3-celled; styles distinct, recurved, 2-branched; ovules two in each cell. Capsule splitting up into 2-valved cocci. Seeds without a caruncle.

Species about 15, in tropical and sub-tropical regions of the world.

S. Acidoton Fawc. & Rendle in Journ. Bot. lvii. 68 (1919).— S. acidothamnus Muell. Arg. in DC. Prodr. xv. pt. 2, 451 (1866); Urb. Symb. Ant. vii. 514, obs. 2. Acidoton frutescens &c. Browne Hist. Jam. 355. Adelia Acidoton L. Syst. ed. 10, 1298 & Amæn. v. 383, 411 (1760). Fluggea acidothamnus Griseb. in Goett. Nachr. (1865) 164. (Fig. 86.) Type in Herb. Linn.

Green Ebony.

Savannas about New Greenwich, Browne! Wright! Swarte! Health-

shire Hills, near Salt Ponds, Harris & Britton! near Albion, St. Thomas; Harris! Fl. Jam. 10,513, 10,819, 12,191.—Bahamas, Cuba, St. Thomas, St. Jan. Santa Cruz.

Shrub 6-10 ft., "the whole plant has a good deal of the appearance of a young Ebony" (Browne). Branches numerous, the youngest twigs zigzag and spiny, apex ending in a spine. Leaves clustered with the flowers, obovate, papery, network of veins dense and prominent, paler beneath,

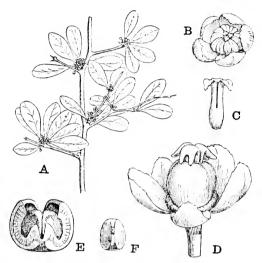

Fig. 86.—Securinega Acidoton Fawc. & Rendle.

·5-1·5 cm. l.; petioles 1-2 mm. l. Pedicels 3-5 mm. l., to 1 cm. in fruit. Male flowers; Buds globular. Sepals roundish, smaller than in the female. Styles of the abortive ovary 3, hooked at apex, as long as the stamens. Female flowers: Sepals roundish, about 2 mm. 1. Styles broad and thick, divided about half-way. Capsule 3-furrowed, 5 mm. in diam. Seeds about 2 mm. l., pale brown.

3. DRYPETES Vahl.

Trees or shrubs. Leaves alternate, leathery, entire, or slightly wavy, with small teeth, or spiny-toothed, somewhat prominently net-veined on both sides. Stipules minute, soon falling. Flowers diccious, without petals, clustered in the axils, male generally numerous, female fewer. Male flowers: Sepals 4-6, imbricate. Disk thick, flattish-concave, pushing outwards between the filaments, so that the filaments appear to be inserted in notches of the disk. Stamens inserted between the calyx and the disk, equal in number and opposite to the sepals (in Jamaican species) or about twice as many. Anthers opening inwardly, but outwardly in *D. ilicifolia*. Rudiment of ovary minute or wanting. Female flowers: Calyx like that of the male. Disk saucer-shaped, crenate. Ovary 2- or 1-celled; stigmas, 2 or 1, flattish, somewhat kidney-shaped, sessile or subsessile at apex of ovary; ovules 2 in each cell. Fruit 2- or 1-celled, somewhat fleshy outside at first, then leathery, tomentellous, with a hard brittle endocarp, not splitting open, with two seeds or only one. Seeds without a caruncle.

Species 13, natives of tropical and subtropical regions in Florida, West Indies, Brazil and Africa.

Leaves entire, wavy, or with small teeth.

On Christopher's Cove, Stoane Herb. 11. 40! St. James, Browne! Grandvale, Westmoreland, Harris! Fl. Jam. 7089.

Shrub 6-10 ft. high, or tree 30 ft. high. Branches with pale grey bark covered with numerous roundish lenticels. Leaves ovate to oblong-elliptical, apex narrowed, acute, ending in a short spine, base slightly unequal, obtuse or acute, margin with large teeth (3-4 mm. 1) ending in a spine (2-4 mm. 1.), somewhat leathery, 7-15 cm. 1., 2 5-7 cm. br.; petioles 4-7 mm. 1. Pedicels 1.5-2.5 mm. 1., in fruit to 4 mm. 1. Male howers greenish, 4-10 in a cluster. Stamens 7-10; filaments scarcely 1 mm. l.; anthers opening outwardly. Female flowers not seen. Fruit 1-celled, somewhat obliquely ellipsoidal, narrowing to base, apex rounded, tomentellous, 1.5-2 cm. l.; stigma sessile. Seed solitary.

4. HYERONIMA Allem.

Trees scaly, sometimes with brownish hairs. Leaves alternate. large, entire; stipules usually small. Flowers small, diœcious, without petals, in axillary panicles. Male flowers: Calyx campanulate, 3-6-toothed. Disk cup-shaped, outside the stamens. Stamens 2-5, opposite the teeth of the calyx. Rudiment of ovary small. Female flowers: Calvx and disk like those of the male. Ovary 2-celled; styles 2-3, very short, 2-cleft, spreading; ovules 2 in each cell. Fruit small, slightly fleshy with hard brittle endocarp, 2-celled with 1 cell empty. Seed generally solitary, without a caruncle.

Species 13, natives of tropical America (including West Indies).

5. SAVIA Willd.

Shrubs or small trees. Leaves alternate, entire, stiffly membranous or leathery. Flowers directious, with rudimentary petals, axillary, male densely clustered, subsessile, female solitary or few, with short or long pedicels. Male flowers: Sepals 5. subequal, imbricate. Petals small, sublinear. Disk ring-like, outside the stamens in the male flower. Stamens 5, opposite the sepals; filaments free; anther-cells close together, opening longitudinally. Ovary rudimentary, with 3 short styles. Female flowers: Sepals and petals like those of the male. Disk ringlike. Ovary 3-celled; styles separate, spreading above, with two awl-shaped acuminate branches; ovules 2 in each cell. Capsule breaking up into 2-valved cocci. Seeds ovoid or 3-edged; without a caruncle.

Species about 10, West Indies.

Leaves elliptical to ovate-lanceolate, acuminate 1. S. sessiliflora. Leaves obovate-elliptical, with rounded apex 2. S. crythroxyloidcs.

1. S. sessiliflora Willd. Sp. Pl. iv. 771 (1806); leaves elliptical to ovate-lanceolate, usually acuminate, stiffly membranous, on the midrib especially at the base and the petioles densely hirtopubescent, otherwise glabrous.—Muell. Arg. in DC. Prod. xv. pt. 2, 231; Urb. Symb. Ant. iv. 337, vi. 90. Croton sessiliforus Sw. Prodr. 100 (1788) & Fl. Ind. Occ. 1179. Phyllanthus laurichius A. Rich. in Sagra Cub. xi. 216, t. 70 (1850). P. pubigerus A. Rich. loc. cit. (Fig. 89.)

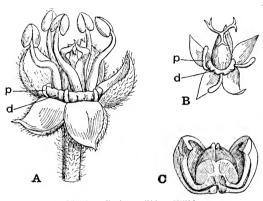

Fig. 89.—Savia sessiliflora Willd. A, Male flower; p, petal; d, disk \times 11. B, Female flower; p, petal; d, disk, enlarged. After Jussieu. C, Coccus with 2 seeds \times 3.

Swartz.—Cuba, Hispaniola, Porto Rico, St. Thomas, St. Cruz, St. Jan. Shrub or tree 12-24 ft. high. Young twigs hirto-pubescent. Leaves 4-8 cm. l. Stipules triangular, acuminate, soon falling, 1.5 mm. l. Sepals pubescent. Petals of both sexes 3-5, sublinear or partly rudimentary, or wanting sometimes in female flowers. Male flowers about 2 mm. l. Stamens 3 mm. l. Female flowers: Ovary glabrous. Capsule glabrous, 8-10 mm. in diam. Seeds solitary, 5 mm. l., broadly ellipsoidal.

We have not seen a specimen from Jamaica. The species is included on the authority of Mueller, who states that he saw in Herb. DC. a specimen collected in Jamaica by Swartz.

2. S. erythroxyloides Griseb. in Mem. Am. Acad. n.s. viii. 157 (1860); leaves obovate-elliptical, with apex usually rounded, narrowed to the base, leathery, glabrous.—Muell. Arg. tom. cit. 230.

Albion Mt., St. Thomas in the East, Harris! Fl. Jam. 11,683, 12,196,

12,198.

Shrub or small tree, 6-20 ft. high. Leaves 2-6 cm. l., somewhat prominently net-veined, especially on the upper surface; petioles 3-5 mm. l. Capsule tomentellous in young state, glabrous when ripe, globular, somewhat flattened at top and bottom, reddish-brown tomentellous when young, glabrous mature, about 8 mm. in diam. Seeds 3-angled, brown, 4-5 mm. 1.

6. PICRODENDRON Planch.

Small trees. Leaves deciduous, alternate, digitately 3-foliolate. Stipules small, inconspicuous, soon falling. Flowers diœcious, without petals. Male flowers: Calvx wanting. Stamens in clusters of 3-54 on a convex receptacle which may be formed of the union of the bases of the filaments, subtended by one or more(-7) imbricate bracts; clusters on peduncled axillary spikes crowded at the ends of young twigs and appearing with the young leaves. Filaments short. Anthers 2-celled, basifixed, dehiscing longitudinally; pollen minutely muriculate. Rudiment of ovary wanting. Female flowers stalked, solitary, axillary. Pedicel expanded at the apex into a concave receptacle. Calvx of 4-5 unequal valvate free sepals, bearing minute glands at the base. Staminodes absent. Ovary superior, 2-celled, outer wall containing numerous vesicles. Style terminal, slender, bearing two large spreading stigmas. Ovules two in each cell, pendulous from the apex of the central axis, anatropous, raphe ventral, integuments two; a reddish-brown cushion-like outgrowth (obturator) springing from the placenta just above the insertion of the pair of ovules and closely roofing over the two micropyles. The obturator does not develop with the growth of the seed, but becomes withered. Fruit a drupe, the thin fleshy exocarp full of vesicles containing a very bitter juice, the woody brittle endocarp marked with four equidistant longitudinal lines containing generally one, occasionally two seeds, one in each cell. Seed pendulous from the top of the cell, without endosperm. Testa membranous infolded between the folds of the cotyledons. Radicle superior.

Species 3, one a native of Jamaica, a second of the Bahamas

and Cuba, and a third of San Domingo.

reticulate with fine meshes. Male flowers: Bracts 1.2-1.5 mm, 1.: anthers about 1 mm. l.; filaments shorter. Female flowers: Sepals 4 or 5, valvate, more or less unequal, slightly toothed, 3-5(-8) mm. 1., linear-lanceolate. Style columnar. Drupe orange-yellow, about 2 cm. in diam., indehiscent. Seed: rhaphe within the furrow of the seed passing out anteriorly into a linear black chalaza, and terminating between the lower lobes of the seed; edible, but should be eaten with caution.

7. CROTON L.*

Trees or shrubs usually more or less covered with brownish or whitish stellate hairs or with scales. Leaves usually alternate, sometimes with 2(-several) glands at the apex of the petiole above, or at base of midrib beneath, or at base of limb beneath. entire, or serrate, sometimes ciliate with glands. monœcious or rarely diœcious (in C. linearis and C. discolor), with petals in male flowers, and in female flowers of C. glabellus (rudimentary or wanting in other Jamaican species), spicate or subracemose at the apex of branches, or sometimes axillary as well as terminal, the male along the upper part of the rhachis, the female on the lower part, solitary under each bract, or sometimes one with two or three male under each bract below. Male flowers: Receptacle generally hairy. Calyx of 5 (4, 6) segments, equal in Jamaican species, valvate or narrowly imbricate. Petals 5 (4). Disk represented by glands. Stamens generally 10-20; filaments bent and anthers pendulous in the bud, both erect in the flower. Rudiment of ovary wanting. Female flowers: Calyx-segments generally equal, but unequal C. alandulosus and C. hirtus, sometimes increasing in size after flowering. Disk ring-like or of distinct scales at the base of the calyx. Ovary 3-celled; styles once or twice divided; ovules solitary in the cells. Capsule splitting up into 2-valved cocci. Seeds smooth with a small caruncle.

Species nearly 700, very widely dispersed in the tropics, and a few in America outside the tropics.

Leaves entire or subentire.

Margin not ciliate with glands.

Glands at base of leaf or apex of petiole.

Diœcious; leaves 2-5 cm. l.; glands at apex of petiole above.

Leaves linear-oblong; nerves not obvious

beneath 1. C. linearis.

oblong to roundish-elliptical; nerves prominent beneath 2. C. discolor.

^{*} The ornamental garden "Crotons" do not belong to this genus, but to Codinum, especially to Codinum variegatum. The species are natives of the islands in the southern Pacific and the Malay Archipelago.

Cane R. valley, 350 ft.; Pedro Bluff; Harris! Fl. Jam. 5724, 6323, 6557, 7235, 9338, 9527, 9580, 9623, 9733.—Florida, Bahamas, Cayman Is., Cuba, Hispaniola.

Shrub 3-9 ft. high, much branched, aromatic; young twigs, inflorescence and calyx tomentellous with yellow (or whitish) flat stellate hairs; diecious. Leaves 5:5-2:2 cm. l., 1:5 mm.-1:5 cm. br., linear-oblong, usually obtuse at both ends, margin entire, upper surface glabrous, beneath covered densely with yellowish tomentum of stellate hairs, usually with two or three cylindrical glands at apex of petiole (often others minute) on upper surface, somewhat leathery; nerves pinnate, usually slightly prominent but indistinct on upper surface, not obvious beneath; petiole 2-6 mm. l. Racemes usually somewhat longer than the leaf. Flowers shortly stalked or subsessile, female usually sessile. Male flowers: Calyx 1.5 mm. 1.

Petals oblanceolate, 2 mm. l., pubescent at base. Stamens 13-15, longer than the petals, filaments glabrous. Female flowers: Calyx 1.8 mm. l., segments triangular-lanceolate. Ovary hirtellous. Styles 2-parted; branches undivided, thick below, apex hooked. Capsule 5 mm. l. Seeds 2.5 mm. l.,

C. Cascarilla Bennett, a distinct species, has lanceolate leaves, acute at both ends, usually with two glands at base of leaf beneath. It is a native of New Providence, Bahamas; the type is in Herb. Mus. Brit. Millspaugh (Field Col. Mus. Bot. ii. 307) errs in including this species under C. linearis.

2. C. discolor Willd. Sp. Pl. iv. 532 (1805); diecious; leaves 2-4 cm. l., 1-2·5 cm. br., oblong-elliptical, oblong-ovate, ovalelliptical, or roundish-elliptical, apex and base rounded or obtuse, mucronulate, subentire, with two or three cylindrical glands (sometimes others minute) at apex of petiole on upper surface, glabrous above, densely whitish- or yellowish-tomentose beneath with flat stellate hairs; nerves pinnate, impressed on upper surface, prominent beneath.—Geisel. op. cit. 18; Muell. Arg. tom. cit. 615; Urb. Symb. Ant. iv. 343.

Near Port Antonio, *Purdie! March!* Orange Bay Point, Hanover, *Harris!* Fl. Jam, 10,261.—Bahamas, Hispaniola, Porto Rico, St. Thomas, St. Cruz.

Shrub to 5 ft. high. Young twigs, petioles, and inflorescence tomentellous with flat yellowish stellate hairs. Leaves somewhat leathery; petiole 5-8(-15) mm. l. Racemes of male plants as long as the leaves to three times as long; clusters of flowers crowded or distant. Pedicels short, to 2 mm.l. Male flowers: Calyx about 2.5 mm.l., 5-parted; segments ovate, with five free sessile twin glands on receptacle at base. Petals 3 mm.l., oblong-oblanceolate, pubescent near base. Stamens 15 or 16; filaments glabrous. Female flowers: Calyx one-third longer than the ovary; segments lanceolate, acuminate. Ovary densely hirtellous with stellate hairs. Styles 2-parted; branches tightly involute, hirtellous.

3. C. Priorianus Urb. Symb. Ant. iii. 295 (1902); monœcious; leaves 6-2·5 cm. l., 1·5-·7 cm. br., narrowly lanceolate or oblong-linear, gradually narrowed towards the apex, apex obtuse or rounded and very shortly apiculate, base rounded or subcordate, margin entire, upper surface roughish with very small stellate hairs, beneath with yellow or whitish tomentum of stellate hairs; with two or more glands at base above and beneath; nerves slightly impressed.—C. Cascarilla a. Griseb. op. cit. 38 (1859).

Prior: March!

Young twigs densely yellow-tomentellous with stellate hairs. Leaves alternate or at the apex opposite or three in a whorl, subleathery; petiole 4-15 mm. l.; stipules wanting. Racemes 2-10 cm. l., tomentellous; peduncle 1-2 cm. l. Male flowers: Sepals 1·5-1·7 mm. l. Petals obovate-lanceolate, a little longer than the sepals, pubescent on the lower margin. Disk-glands transversely oblong-elliptical. Stamens about 16. Female flowers subsessile: Sepals 2 mm.l., lanceolate. Petals very minute, gland-like. Disk-glands transversely rectangular-elliptical. Ovary globular, tomentose. Styles 2-parted almost to the base, branches undivided. Cansule (not ripe) globular, 4-5 mm. in diam.

4. C. flavens L. Syst. ed. 10, 1276 (1759) & Aman. v. 410, 383; leaves 2-10 cm. l., ovate-lanceolate to ovate, tapering to an acute mucronate apex, base cordate or obtuse, on both sides tomentellous with stellate hairs to sparingly stellate-hairy or even glabrous, entire or rarely serrate, with several minute glands often at apex of petiole or base of midrib above, and one cylindrical gland at each side of base of midrib beneath.— Geisel. op. cit. 19; Griseb. op. cit. 38; Muell. Arg. tom. cit. 612. C. balsamifer Jacq. Sel. Stirp. Amer. 255, t. 162, f. 3 (1763) & Hort. Vindob. iii. 26, t. 46; L. Mant. 125; Geisel. op. cit. 11; Griseb. loc. cit. C. flocculosus Geisel. op. cit. 14 (1807); Griseb. loc, cit. C. fruticulosum et villosum &c. Browne Hist. Jam. 347. Type, Browne's specimen, in Herb. Linn.

Yellow Balsam.

Sloane Herb. v. 108! Houstoun! Lane in Herb. Sloane clxii. 127! Browne! Wright! near Bull Bay, Broughton! McNab! Liguanea plain, Purdie! March! Rock Fort, Campbell! Long Mt., 30-200 ft.; Harris! Fl. Jam. 6254, 8926, 9586.—West Indies, Yucatan.

Shrub 2-10 ft. high, aromatic. Leaves: nerves pinnate; petiole less

than half as long as the limb. Flowers pale yellow or white, shortly pedicelled (1-3 mm. l.). Male flowers: Calyx stellate-tomentellous outside, about 2 mm. l.; segments narrowly ovate. Petals oblanceolate, a little longer than the calyx, hairy at lower margin. Stamens 12-16. Female flowers: Calyx like the male, but more pointed. Petals minute, threadlike, gland-like at apex. Ovary tomentellous with yellow stellate hair. Styles 2-cleft. Capsule subglobular, about 5 mm. l. Seeds ellipsoidal, 3-3.5 mm. l., dark grey.

5. C. micans Sw. Fl. Ind. Occ. 1185 (1800) (excl. syn.); leaves 3-5 cm. l., ovate-lanceolate, acuminate, base obtuse or slightly cordate, upper surface with a few hairs on the nerves. also sometimes a few stellate scale-like hairs often bearing in the centre a long hair, beneath densely tomentose, with short white stellate hairs and scales, without glands at base; stipules awlshaped, 2-3 mm. l.; calyx of female flowers densely scaly, segments ovate-triangular, with edges near base slightly folded back outwards.—Muell. Arg. tom. cit. 554 (with vars.) & in Fl. Bras. xi. pt. 2, 121. C. nervosus var. villosus Klotzsch in Hook. Lond. Journ. Bot. ii. 50 (1843). C. niveus Grisch. op. cit. 40 (1859) (non Jacq.).

Swartz.—Northern tropical S. America. A specimen from Jamaica, without collector's name, in Herb. Edinb. is named by Grisebach

Shrub with twigs, petioles, stipules, and young leaves covered with long soft spreading yellowish-brown hairs. Leaves ovate-lanceolate, acuminate, base obtuse or slightly cordate, nerves pinnate, without glands at base, with a few hairs on the nerves on the upper surface, also sometimes a few scattered stellate scale-like hairs often bearing in the centre a long hair, beneath densely tomentose with short white hairs and scales, 3-5 cm. l.: petiole 3-8 mm, l.; stipules awl-shaped, 2-3 mm. l. Racemes with 1-3 female flowers at base succeeded by several male flowers above. Pedicels

1-2 mm. l. Bracts thread-like about 1.5 mm. l. Male flowers (just opening): Calyx densely tomentose inside and outside with stellate hairs, 5-parted, segments elliptical, 1.5 mm. l. Petals about 2 mm. l., white, oblong, densely covered inside and on margins with long white hairs, puberulous outside except at apex. Stamens 10-14; filaments hairy. Female flowers: Calyx, covering like that of male, 5-parted, 4 mm. l., segments ovate-triangular, with edges near base slightly folded backwards. Petals generally wanting, but sometimes one or more present spathulate, hairy, two-thirds as long as the calyx. Ovary densely hairy with scaly hairs with long rays. Styles pubescent, 2-parted, branches 2-parted again. Capsule somewhat rough with scales more or less persistent, pubescent styles persistent, 6-7 mm. l. Seeds ellipsoidal, smooth, brown, 4 mm. l.

6. C. ovalifolius Vahl in West Bidr. Ste. Croix (1793); leaves varying much in size, the larger 1·5-3·5 cm. l., ovalelliptical to oblong-elliptical, apex rounded or obtuse, base obtuse to wedge-shaped, entire, upper surface glabrous, beneath more or less hispid with stellate hairs, without glands on margin or at base; stipules linear-acuminate, glandular.—Griseb. op. cit. 41; Muell. Arg. in DC. Prodr. xv. pt. 2, 648. C. diffusus Geisel. op. cit. 41 (1807). Specimen from West, St. Cruz, in Herb. Mus. Brit.

Near Kingston, McNab! Prior! March! Windward road, near Kingston; Liguanea Plain; Campbell! Long Mountain, 100 ft.; Harris! Fl. Jam. 6015, 6102, 11,869, 12,119.—Hispaniola, St. Thomas, St. Cruz,

Guadeloupe, Venezuela.

Shrub ½ to 1 ft. high, much branched; young twigs pubescent or hispid with stellate hairs, or glabrescent. Leaves varying much in size, the larger 1·5-3·5 cm. l., oval-elliptical to oblong-elliptical, apex rounded or obtuse, base obtuse to wedge-shaped, without glands, upper surface glabrous, beneath more or less hispid with stellate hairs; nerves 3 at base, pinnate above; petiole 1-1·5 cm. l.; stipules linear-lanceolate, with short glandular branches. Racemes short, 2-3 cm. l. Bracts linear-lanceolate, denticulate. Male flowers: Calyx 2·5 mm. l.; segments oblong-ovate, pellucid-dotted, puberulous-tufted at apex. Petals 2 mm. l., lanceolate, pubescent on lower half inside. Stamens about 10; filaments pubescent below. Female flowers: Calyx 4 mm. l., increasing to 5·5 mm. in fruit, segments linear-lanceolate, fringed with glandular projections. Ovary hispid. Styles 4-6-parted. Capsule 4·5 mm. l., globular, glabrescent, exceeded by the calyx. Seeds 3-sided, convex on back, brownish, barely 3 mm. l.

7. C. lucidus L. Syst. ed. 10, 1275 (1759) & Amæn v. 410, 383; leaves crowded towards the apex of the branches, so as to appear opposite or ternate, 4–10 cm. l., lanceolate-elliptical, elliptical, or oblong-elliptical, subacuminate (or rarely roundish), apex obtuse, margin entire or sometimes obtusely and remotely serrate, glabrous or with stellate and simple hairs on both sides, without glands at the base; calyx of female flowers with a few stellate hairs, about three times as long as male; segments oblong, with edges near base folded back outwards.—Sw. Fl. Ind. Occ. 1193; Griseb. (incl. vars.) loc. cit.; Muell. Arg. in DC. Prodr. xv. pt. 2, 561; Urb. Symb. Ant. iv. 341. Croton erectum glabrum,

Hispaniola, Porto Rico.

Shrub 2-12 ft. high, or tree to 40 ft., aromatic. Young parts of twigs and racemes, flowers sometimes more or less stellate-puberulous, sometimes glabrate or glabrous. Leaves pellucid-dotted, nerves and veins more or less indistinct, nerves pinnate and sometimes with two on each side at base; petiole 1-3 cm. l. Racenes 3-8 cm. l. Flowers white or greenish-white. Pedicels, male to 2.5 mm. l., female 2.5-5 mm. l., of fruit 5-8 mm. l. Male flowers: Calyx about 2 mm. l., 5-parted, densely puberulous on the margins, also more or less on both surfaces; segments oblongelliptical, base and margins sometimes glandular. Petals like the sepals, and as long. Stamens 11-12. Female flowers: Calyx 5-6.5 mm. l., 5-parted, puberulous. Ovary sparingly pubescent with stellate hairs. Styles short, about 1 mm. l., deeply 4-parted. Capsule oblong-ellipsoidal, glabrate, 10-12 mm, l.

The descriptions in English by Sloane of this species and C. glabellus

in the "History" have been exchanged.

8. C. laurinus Sw. Prodr. 100 (1788) & Fl. Ind. Occ. 1191; leaves 7-18 cm. l., broadly elliptical to oblong-elliptical, apex rounded, obtuse or acute, base rounded to wedge-shaped, entire, on both sides with stellate hairs, often glabrate, without glands at base.—Geisel. op. cit. 31; Griseb. op. cit. 39. C. laurifolius Muell. in DC. Prodr. xv. pt. 2, 586 (1866). Type from Swartz in Herb. Stockholm, and a specimen from him in Herb. Mus. Brit.

Swartz! Union Hill, Moneague, Prior! near Troy, 2000-2200 ft.; Albion Pen, St. Ann, 2000 ft.; Harris! Fl. Jam. 8693, 9410, 12,000, 12,003. A high shrub with weak straggling branches, or a slender tree, 20-25 ft. high; "fresh juice of branches blood-red" (Harris). Stellate hairs on young branches, leaves and petioles, inflorescence, calyx, orary, capsule. Leaves 7-18 cm. l., broadly elliptical to oblong-elliptical, apex rounded, obtuse, or acute, base rounded to wedge-shaped, entire, without glands at base, papery; nerves pinnate; petiole 1-6 cm. l. Racemes axillary, usually longer than the leaves, sometimes much longer, 1-3 dm., sometimes with male flowers only. Bracts minute. Male flowers: Calyx about 2 mm. l.; segments triangular, about 1.5 mm. l. Petals oblanceolate, 2.3 mm. l., apex doubled outwards, pubescent on the margin and with dense short hairs at apex. Stamens 5-10, filaments glabrous. Female flowers: Pedicels thick, about 2 mm. br., about 3 mm. l. Calyx 4 mm. l.; segments lanceolate, 3 mm. l. Petals minute, linear, gland-tipped, hairy. Ovary hirtellous. Styles cut into 3-6 linear recurved branches down to a broad base. Capsule 1.5 cm. l. Seeds ellipsoidal, smooth, 9 mm. l.

Var. adenophyllus, var. nov., differs from the species in the general absence of hairs on the leaf and in the flower, and in being more glandular.—C. adenophyllus Spreng. Syst. iii. 869 (1826); Griseb. op. cit. 40; Muell. Arg. tom. cit. 644.

Fl. Jam. 5115, 5477, 6017, 6264, 9187, 9581, 9628, 9750, 10,708, 11,755.—Bahamas, Mexico, Colombia, Ecuador.

Shrub or tree, 10-30 ft. high, aromatic. Leaves elliptical, oblong-elliptical, or oblong-ovate, entire, very variable in size, 2-15(-20) cm. 1, at both ends obtuse, sometimes subacute, base often rounded or subcordate, with a few round whitish scales on the upper side, nearly covered beneath with silvery scales, pinnately nerved, pellucid-dotted, without glands at the base; petiole 2 mm.-2 cm. 1. Raccmes generally branched, rarely simple, usually only half as long as the leaves, rarely longer than the leaves, 3-12 cm. 1., dense-flowered, in axils near apex as well as terminal. Pedicels of male fl. 2 mm. or less, of female 4 or 5 mm., increasing in fruit to 9-14 mm. Flowers white or pale yellow. Male flowers: Calyx 2-2·4 mm. 1., 5-parted; segments ovate-triangular, margin colourless, puberulous. Petals slightly longer than calyx, white, puberulous outside and especially dense on margins, oblong. Stamens 10-13; flaments hairy below. Female flowers: Calyx and petals much like the male, but sepals broader, petals lanceolate, both persistent. Ovary scaly, somewhat scurfy. Styles 2-branched, branches again 2-parted once or

twice. Capsule obovoid-globose, tuberculate, scaly, scurfy, 7-9 mm. l. Seed dark brown, 6 mm. l.

Wright (loc. cit.) considers that "the bark is the same as the cascarilla

and eleutheria of the shops."

10. C. humilis L. Syst. ed. 10, 1276 (1759), Amæn. v. 410, 383, & Sp. Pl. ed. 2, 1427; leaves 1·5-5·5 cm. l., ovate to ovate-lanceolate, more or less acuminate, base more or less cordate or rounded, margin with distant minute stalked glands, upper side somewhat puberulous, stellate-haired, or glabrescent, beneath white or yellowish-grey with stellate tomentum, without distinctly basal glands; stipules minute, with glandular lobes, or conspicuous, split up into linear glandular lobes.—Sw. Obs. Bot. 363; Geisel. op. cit. 15; Griseb. op. cit. 41 (excl. var.); Muell. Arg. tom. cit. 670; Urb. Symb. Ant. iv. 343. C. fruticulosum minus &c. Browne Hist. Jam. 347. C. salvifolium Mill. Jam. 6266, 8284, 9585, 9676, 10,183, 10,788.—Florida, Bahamas, Hispaniola, Porto Rico, St. Thomas,

Mexico, Yucatan.

Shrub 1–5 ft. high, aromatic. Young twigs, inflorescence, ealyx whitish or yellowish-grey with stellate tomentum. Leaves pinnate-nerved, with one or two nerves on each side from the base; petiole usually half as long as the leaf. Racemes slender, 3–14 cm. l. Bracts small, ovate, acuminate, more or less cut into gland-bearing segments. Pedičels: male 2–4 mm. l., female 1–2 mm. l. Flowers white. Male flowers: Calyx 2–2 7 mm. l.; segments elliptical. Petals about as long as calyx, elliptical, narrowed to base, pubescent at apex and on margin of lower half. Disk represented by fleshy glands opposite the sepals. Stamens indefinite in number, over twenty. Female flowers: Calyx 4 mm. l., increasing in fruit; segments usually ciliate with stalked glands, oblong, somewhat broader near apex. Petals thread-like, gland-tipped, nearly 2 mm. l. Disk ring-like. Ovary with stellate hairs. Styles 4-parted, thread-like, hairy, involute at apex. Capsule 5–6 mm. l., glabrate, globular-3-lobed. Seeds usually with slight diagonal ridges on back, 3–4 mm. l.

11. C. corylifolius Lam. Encyc. ii. 205 (1786); one female flower and two or three male flowers in the axil of each lower bract; leaves varying much in size, 3-13 cm. l., broadly ovate, or elliptical to oblong-elliptical or oblong, base subcordate or obtuse, margin irregularly serrate-dentate, sometimes with cylindrical glands, teeth glandular, with two glands at apex of petiole above, youngest leaves covered with stellate hairs, older sparsely covered or glabrescent; stipules linear-acuminate, 5-6 mm. l.,

dark coloured, with a few stellate hairs, soon dropping off.— Geisel. op. cit. 29; Griseb. op. cit. 39; Muell. Arg. tom. cit. 549. C. montanus Geisel, op. cit. 23.

Pedro savanna, St. Elizabeth, Purdie! Wilson! Moneague, Prior! Falls River, 2000 ft.; Chelsea Hill, St. Cruz Mts., 2200 ft.; Peckham, Clarendon, 2500 ft.; Middlesex, St. Ann, 1600 ft.; Harris! Fl. Strub or tree, 12-30 ft. high, aromatic. Upper portions of twigs, also leaves, petioles, inflorescence, covered with whitish stellate hairs, dense on youngest parts. Leaves: stellate hairs more or less dense beneath, somewhat sparse on upper surface, papery; nerves 3-5 at base, pinnate above; petiole usually about one-third as long as the limb, sometimes nearly one-half as long, 1-3(-5) cm. l. Racemes 1-2 dm. l. Flowers subsessile. Male flowers: Calyx 2.5 mm. l., segments oblong-ovate. Petals slightly over 2 mm.l., oblanceolate, densely woolly inside. Stamens 16-18; filaments glabrous. Female flowers: Calyx 3 mm.l.; segments about 2 mm. l. Petals about 1 mm. l., linear, gland-tipped. Ovary white-tomentellous with stellate hairs. Styles branching into two below the middle, branches entire. Capsule about 1 cm. l., ellipsoidal, covered with stellate hairs.

12. C. populifolius Lam. Encyc. ii. 205 (1786); leaves 3-11 cm. l., ovate, shortly acuminate, base cordate, obtuse, or acute, serrate, with a few stellate hairs on both sides, teeth at base glandular, basal glands various, sometimes linear or wanting; stipules 5-10 mm. l., cut into linear gland-tipped segments.— Sw. Prodr. 101 & Fl. Ind. Occ. 1197; Geisel. op. cit. 27; Griseb. op. cit. 41; Muell. Arg. tom. cit. 653. C. hircinus Vent. Jard. Malm. 50 with t. (1803).

Southern parts, Swartz!—Cuba, Martinique, St. Vincent, Grenada, Bequia, Venezuela, Colombia, Panama.

Shrub to 5 or 6 ft. high, with a goaty smell; young parts villose. Leaves: nerves two on each side from base, pinnate above; petiole as long as the leaf to one-third as long. Racemes 5-15 cm. l. Bracts lanceolate, toothed, 4 mm.l. Male flowers: Calyx about 2.5 mm.l.; segments ovate, with a few stellate hairs outside, or glabrate. Petals about 3 mm. l., elliptical. Stamens 8-12; filaments pubescent below. Female flowers: Calyx about 5 mm. l.; segments oblong-lanceolate, villose outside and with groups of two or three glands together at intervals. Petals linear or lanceolate, acute, sometimes wanting. Disk ring-like. Ovary hispid with stellate hairs. Styles 4- or 5-parted, glabrous. Capsule 6-7 mm. l., broadly ellipsoidal.

13. C. Wilsonii Griseb. Fl. Brit. W. Ind. 40 (1859); leaves crowded as if whorled, 10-4 cm. l., elliptical to oblong-lanceolate, short or long acuminate, serrulate, teeth glandular, upper surface glabrous, beneath with a few stellate hairs, at length glabrate; glands cylindrical at base of midrib beneath, 2 or 1, or wanting; stipules small, inconspicuous.—Muell. Arg. tom. cit. 660.

Wright! Lime savanna, Clarendon, Purdie! Wilson! Fawcett! Grandvale, Westmoreland, 500 ft.; Lapland, near Catadupa, 1500 ft.; Spur Tree Hill, 2000 ft.; Black River to New Market, 150 ft.; near lighthouse, Negril, 300 ft.; *Harris*! Fl. Jam. 7102, 9167, 9859, 9880, 10,240; Negril, *Britton & Hollick*, 2083!—Type in Herb. Kew.

Shrub 3-9 ft. high; some of the nodes suppressed where the branches or inflorescence spring, so that three to five leaves come close together, as if whorled; young twigs rough with scattered flat-stellate hairs, at length glabrate. Leaves: nerves 3 at base, pinnate above; petiole 3-20 mm. 1. Racemes terminal or axillary, 3-9 cm. l., glabrous. Bracts lanceolate, about 1 mm. l. Pedicels: male to 6 mm. l., in clusters of five or six, one flower opening at a time. Male flowers: Calyx about 2 mm. l., segments ovate-elliptical, glabrous, with a minute tuft of hairs at apex. Petals narrowly ovate-elliptical or obovate, 2.5 mm. 1., pubescent on the lower half inside. Stamens about 24(-35 fide Muell.); filaments glabrous. Female flowers sessile, somewhat numerous. Calyx: segments 2.5-3 mm. 1.; linear-lanceolate, without glands. Petals rudimentary. Ovary very hispid. Styles once 2-parted or 2-cleft, slender, longer than the ovary, coiled inwards at the apex. Capsule globular, about 5 mm. l. Seeds about 4 mm. l.

14. C. glandulosus L. Syst. ed. 10, 1275 (1759) & Amæn. v. 383, 409; leaves 2-3.5 cm. l., oblong-ovate, ovate, or elliptical, base obtuse, coarsely serrate, both sides sparsely covered with flat stellate hairs, or glabrescent, with two shortly stalked saucer-shaped glands at base of limb beneath (less than 1 mm. l.); stipules linear, not glandular, about 2 mm. l., soon falling.— Geisel. op. cit. 64; Griseb. op. cit. 41; Muell. Arg. tom. cit. 683; Urb. Sumb, Ant. iv. 343. C. divaricatus Sw. Prodr. 100 (1788) & Fl. Ind. Occ. 1187; Geisel. op. cit. 32. C. corchorifolius Geisel. op. cit. 25 (1807). Type in Herb. Linn. from Browne.

Browne! Broughton! Masson! St. Andrew, McNab! Macfadyen, Kingston, Prior!.—Cuba, Hispaniola, Porto Rico, St. Cruz, Antigua, Guadeloupe, Martinique, Trinidad, Curação, continental America.

Herb ½ to 2 ft. high; stems usually herbaceous, sometimes woody, above with flat stellate hairs on branches, leaves, inflorescence, calyx, or glabrate. Leaves oblong-ovate, ovate, or elliptical base obtuse, coarsely serrate, with two shortly stalked saucer-shaped glands at base of limb beneath (less than 1 mm. l.), nerves pinnate and two at each side of the base, 2-3.5 cm. l.; petiole $\frac{1}{3}$ - $\frac{1}{3}$ as long as the blade; stipules linear. Racemes with subsessile flowers, 1.5-2 cm. l., or shorter. Bracts linear, with a small stalked globular mucronate gland on each side at the base. Male flowers: Calyx about 2 mm. l., segments oblong-elliptical, acute. Petals slightly longer than the calyx. Stamens 10, filaments glabrous. Female flowers: Calyx: segments unequal, spathulate with acute apex, to 3 mm. l., increasing in fruit to be nearly or quite as long as capsule. Petals minute, linear-lanceolate, gland-tipped. Ovary hirsute. Styles 2-parted almost to the base. Capsule 5-6 mm. 1., globular-ellipsoidal, glabrate or with a few small stellate hairs. Seeds 4 mm. l., lined on the back with rows of minute pits.

15. C. hirtus L'Hér. Stirp. 17, t. 9 (1784); leaves 4-5.5 (2.5-7) cm. l., roundish to ovate, sometimes slightly lobed, some, especially the larger, doubly crenate-serrate, the smaller serrate, both sides with flat stellate hairs, usually only one ray developed on upper surface, with two long-stalked, cup-shaped, small glands at base of limb on margin (1.5-2 mm. l.); stipules linear, to 5 mm. 1., not glandular. — Geisel. op. cit. 62; Griseb. op. cit. 42. C. glandulosus var. hirtus Muell. Arg. tom. cit. 684 (1866).

St. Andrew, McNab! Kingston, Prior! Ferry; Liguanea plain; Campbell! King's House grounds, T. Harris! Liguanea plain, Harris! Fl. Jam. 5794, 6081, 6774, 6959, 11,799.—Trinidad, Central and tropical

Herb 1 to 2 ft. high; stems herbaceous; twigs densely covered with stellate hairs with one or more of the rays longer and more or less erect, the others much shorter and adpressed. Leaves: nerves prominent beneath, pinnate with two on each side at base; petiole usually \(\frac{3}{4} \) to \(\frac{1}{3} \) as long as the blade, of upper leaves shorter. Racemes with subsessile flowers, 1.5-2.5 cm. l. Bracts linear, 2-4 mm. l., with or without stalked glands. Male flowers: Calyx 1.5 mm. l.; segments elliptical to oblongelliptical, acute, with stellate hairs outside. Petals oblong-linear, delicate. about as long as the calyx. Stamens about 10, filaments glabrous. Female flowers: Calyx, segments unequal, two longer, about 2.5 mm. l., two shorter, one very much shorter, obovate-oblong, becoming spathulate in fruit, and increasing to 4 mm. 1. Ovary hirsute. Styles, two parted almost to the base. Capsule about 4 mm. 1., globular or globular-ellipsoidal, with stellate hairs. Seeds 3 mm. 1., pits indistinct, very dark grey with black dots.

16. C. Griesbachianus Muell. Arg. in Flora xlvii. 484 (1864) & in DC. Prodr. xv. pt. 2, 586; leaves 3-7 cm. l., oblong, elliptical, or ovate, apex obtuse, acute, or shortly subacuminate, base subcordate, obtuse, or truncate, more or less doubly serrate or serrulate, upper surface sparsely covered with stellate hairs or glabrate, beneath denser, without glands at base.—C. Iserti Griseb. Fl. Brit. W. Ind. 39 (non Geisel.). Griesbach's type in Herb. Kew.

March! Long Mountain, 700-900 ft., Harris! Healthshire Hills, Harris & Britton! Fl. Jam. 8944, 9614, 10,520. Shrub 5-12 ft. high. Youngest parts of twigs, petioles, and youngest leaves covered with brownish, stellate tomentellum. Leaves 3-7 cm. l., oblong, elliptical, or ovate, apex obtuse, acute, or shortly subacuminate, base subcordate, obtuse, or truncate, more or less doubly serrate or serrulate, without glands at base, papery, upper surface sparsely covered with stellate hairs or glabrate, beneath more densely covered; nerves 3-5 at base, pinnate above; petiole '5-2.5 cm. l. Racemes axillary as well as terminal, 2-4 cm. l. Pedicels 1-2 mm. l. Bracts linear-lanceolate, 1.5-4 mm. l. Male flowers: Sepals 5, about 2 mm. l., linear-lanceolate, stellate-haired outside. Petals 5, about 1.2 mm. l., oblong-elliptical, pubescent on the margin, with a bunch of long hairs at apex. Stamens about 12; filaments glabrous. Female flowers solitary at base of raceme. Sepals 5, linear, 3.5-4 mm. l. Ovary tomentellous. Styles 4-cleft, each branch with two short curved branches. Capsule not seen.

8. ARGYTHAMNIA Sw.

Shrub (in A. candicans), undershrubs, or perennial herbs, containing a purple pigment. Leaves alternate, entire or with few teeth, 3-nerved at base. Flowers monœcious, with petals, in axillary spike-like 2-sexual racemes, each subtended by a bract, the upper flowers male, the lower (1-3) female; the glands of the disk alternate with the petals. Male flowers: Calyx-segments 4(-5), valvate. Petals 4(-5). Stamens 4(-5); filaments united at the very base; anthers dersifixed. Female flowers: Sepals 5, imbricate. Petals 5, minute. Ovary 3-celled; styles spreading, variously cut; ovules solitary in the cells. Capsule breaking up into three 2-valved cocci. Seeds without a caruncle.

Species 55, natives of tropical and subtemperate America,

including the West Indies.

A. candicans Sw. Prodr. 39 (1788) & Fl. Ind. Occ. 336, t. 8; Jussieu Euphorb. Tent. t. 7; Baill. Étud. Euphorb. t. 15, f. 30-36;

Cruz, St. Jan, St. Martin, St. Bartholomew, St. Lucia.

A straggling shrub, prostrate to 5 ft. high, with whitish bark, and all parts of the plant grey-whitish or purplish. Leaves 2–8 cm. 1., lanceolate or lanceolate-elliptical, apex acute, base subacute, serrulate, adpressed-pubescent, glabrescent, or glabrate; nerves one on each side from the base, otherwise pinnate, prominent beneath. Racemes 1 cm. 1. or less. Flowers greenish-white or whitish. Male flowers: Calyx about 2·5 mm. 1.; segments 4, narrowly elliptical. Petals 4, as long as calyx, broadly elliptical, tapering to a very acute base, sometimes sub-3-lobed above. Stamens 4, longer than the calyx. Female flowers: Calyx-segments 5, 3 mm. 1., increasing to 4·5 or 6 mm. in fruit, oblong-elliptical, oblong-oblanceolate to sublinear in fruit, puberulous all over. Petals minute, about 5 mm. 1., lanceolate. Ovary villose; styles villose, 2-forked once, each branch 2-lobed at apex. Capsule 3–4 mm. 1., 5–6 mm. br. Seeds 2–2·5 mm. 1., net-veined, obovoid.

9. CAPERONIA St. Hil.

Erect annual herbs, growing in swampy places, stems succulent. Leaves alternate; stipules persistent. Flowers monocious (in W. Indian species), with petals, in 2-sexual axillary spikes or spike-like racemes, each subtended by a bract, the upper flowers male, the lower female. Disk wanting. Male flowers: Calyx-segments 5 or 6, valvate. Petals 5, imbricate, attached at the base of the staminal column and raised above the calyx. Stamens usually 10 in two whorls round the column; anthers ovoid, the cells separated by a short connection, and affixed at the middle, or subpendulous. Rudiment of the ovary at the apex of the column. Female flowers: Sepals 5 or 6, imbricate, generally unequal, the outer smaller than the inner. Petals 5. Ovary 3-celled; styles short, cut into many segments; ovules solitary in the cells. Capsule breaking up into three 2-valved cocci, spiny. Seeds subglobular, without a caruncle, very minutely dotted in a network pattern.

Species 33, natives of the tropics in America and Africa.

Syst. ed. 10, 1298 (1759) & Amen. v. 383. (Fig. 94.) There is a specimen from Browne in Herb. Linn. in genus cover Adelia, and named by Linneus Bernardia. A type from Grisebach is in Herb. Kew.

Houstoun! Browne! Wright! Masson! Bertero; Wilson! March! Long Mt., 350 ft., Campbell! Round Hill, St. Cruz Mts., 1600 ft.; Luana Point; Long Mt., 100 ft.; Albion Mt., St. Thomas; Harris! Fl. Janu. 6146, 9704, 9902, 11,945, 12,192.—Bahamas, Cuba, Cayman, Hispaniola, Porto Rico, St. Vincent.

A straggling shrub, 2-18 ft. or tree 25 ft. high, monœcious or diœcious. Leaves 3-10 cm. l., elliptical-ovate, oblong-ovate, or lanceolate, serrate, tomentose with some stellate hairs on both sides; nerves 2 on each side at base, pinnate, slightly prominent beneath; petiols 5-12 cm. 1, tomentose; stipules linear-acuminate, 2 mm. 1. Spiles ·8-3·4 cm. 1. or shorter, tomentose. Bracts: male, about 1.5 mm. l., densely puberulous outside, transversely somewhat elliptical, margin serrate, with 3-5 flowers; female, one with 2 bracteoles under each flower, narrowly ovate. Male flowers opening after fall of subtending leaf: Calyx about 2 mm. l., puberulous outside; segments elliptical, acute. Receptacle glandular. Stamens 15-25, longer than the calyx. Female flowers: Calyx about 2.5 mm. l., puberulous outside; segments unequal, ovate, acute. Ovary deusely tomentose. Capsule globular-3-lobed, tomentose, 7 mm. l. Seeds globular-ovoid, slightly 3-angled, marbled with blackish marks, 6 mm. 1.

11. ADELIA L.* (in part).

Shrubs, glabrous (except inflorescence), more or less spiny. Leaves alternate or crowded at the nodes, membranous or paperv (when drv), entire; petioles very short. Flowers small. diocious, without petals, clustered on cushions in axils of leaves. the male short-stalked or sessile, the female long-stalked, solitary or in clusters of 2 or 3. Male flowers: Calvx closed in bud, valvately 5-parted in flowering. Disk attached to the base of the calyx. Stamens 8-15; filaments attached to a central column or prominence; anthers versatile, attached near the base at the back, cells parallel, opening longitudinally. Female flowers: Calyx 5-parted, valvate. Disk flattened. Ovary 3-celled; styles 3, reflexed-spreading, much cut; ovules solitary. Capsule splitting up in three 2-valved cocci. Seeds subglobular, without a caruncle.

Species about 10, natives of the West Indies and Central America.

^{*} Adelia of Browne (Hist. Jam. 361, t. 36, f. 3) is Forestiera porulosa Poir. (Encyc. Suppl. ii. 664) = Myrica segregata Jacq. (Coll. ii. 273) = Adelia segregata Kuntze Rev. Gen. ii. 409 (Olcacea).

Stamens attached to a central prominence. Leaves oblong-obovate, or elliptical, or obovate............ 1. A. Ricinella. Stamens attached to a central column. Leaves oblanceolate 2, A. hamiolandra.

Wright! Swartz! arid plains, Westmoreland, Purdie! Watson's Hill, Manchester, 800 ft.; Negril; between Town Savanna and Two Mile Wood, Sloane Herb. vii. 109! Harris! Fl. Jam. 6378, 10,222, 10,234.—Cuba, Hispaniola, Porto Rico, St. Thomas, St. Cruz, St. Jan, St. Martin, Tobago.

Tree 15-30 ft. high, or shrub 6-10 ft.; branches with white bark, erect to spreading, apex spiny, glabrous. Leaves 1·5-7·5 cm.l.; petiole 1-5 mm.l. Male flowers: Pedicel as long as, or longer than, the flower. Calyx 2·5-3 mm.l., sepals unequal, oblong. Disk saucer-like, margin orange-coloured. Female flowers: Pedicel 1-5 cm. l. Sepals unequal, to 3 mm. 1., lanceolate to linear. Ovary tomentose. Capsule 8 mm. in diam.,

5 mm. l., puberulous, flattened-globular-3-lobed. Seeds globular, 3 mm. in diam., light brown.

2. A. hæmiolandra Pax in Engler's Pflanzenreich iv. 147. vi. 77 (1912); leaves oblanceolate; stamens 15, springing from a central column, ten about halfway, five higher up.—Ditaxis hæmiolandra Griseb. Fl. Br. W. Ind. 44 (1859). Ricinella hæmiolandra Muell. Arg. in DO. Prodr. xv. pt. 2, 730 (1866). Type in Herb. Kew.

Macfadyen! Purdie!

Shrub with white bark, branches sometimes with axillary spines, glabrous. Leaves 4-7 (3-8) cm.l.; petiole 3-4 mm.l. Male flowers: Pedicels about as long as the flower. Calyx tomentellous outside, about 3 mm.l., sepals more or less equal, oblong-ovate, acute. Disk irregularly lobed, lobes opposite sepals. Female flowers not seen.

12. LASIOCROTON Griseb.

Shrubs or trees. Leaves alternate, nerves pinnate. Flowers monœcious or diœcious, without petals, in spikes, or racemes, or panicles, which are solitary in the upper axils; the male spikes with flowers densely crowded in clusters, the female racemes long, lax, with several stalked distant flowers; pedicels jointed. Male flowers: Calyx ovoid, closed in bud, at length splitting into five valvate segments. Disk poorly developed. Stamens 8 to 18. Rudiment of ovary wanting. Female flowers: Calyx small, 5-parted, spreading, open in bud. Disk thick, entire. Ovary 3-celled; styles very shortly united below, short, thick, undivided or 2-lobed, apex very shortly fringed; ovules solitary. Capsule deeply 3-lobed-globular, splitting up into three 2-valved cocci. Seeds globular, without a caruncle.

Species 3 or 4, natives of Jamaica, Bahamas and Cuba.

Venation of leaves beneath not prominent. Styles 2-cleft halfway.

Leaves glabrous beneath. Petioles long,

7-2·5 cm. l. 2. L. Fawcettii. Leaves tomentose beneath. Petioles short,

1. L. macrophyllus Grisch. Fl. Br. W. Ind. 46 (1859): leaves 5-14 cm. l., roundish, elliptical, or ovate, apex acute, obtuse, or rounded, base slightly cordate, leathery, tomentose and soft to the touch on both sides, nerves and veins very prominent beneath, more or less evident above, two on each side near the base: petioles 1:5-4 cm. l., tomentose; styles not divided.—Muell. Arg. in DC. Prodr. xr. pt. 2, 955; Millsp. in

Field Columb. Mus. Bot. ii. 156. Croton macrophyllus Sw. Prodr. 100 & Fl. Ind. Occ. 1196. (Fig. 96.)

florescence $\times \frac{2}{3}$. B, Male flower \times 5.

C, Stamens × 10.

2 cm. l. Male flowers growing together in close clusters, the older flowers developing pedicels and dropping off probably soon after opening. Calyx globular while unopened. Stamens 8-13; filaments short, partially united at the base; anthers attached at a point about the middle. Fruiting racemes spreading or pendulous, 5-1 5 dm. l. Pedicels 8-4(-2) mm. l. Fruiting calyx 2-3 mm. 1. Capsule 5 mm. 1. Seeds dark olive-grey with blackish markings, 3 mm. in diam.

Specimens from Bahamas (Wilson 7833) and Cuba (Shafer 2554) with young male flowers only have been referred to this species, but appear to

us to be different.

2. L. Fawcettii Urb. Symb. Ant. vi. 14 (1909); leaves 15-26 cm. l., oval-elliptical, acuminate, base obtuse or somewhat

acute, somewhat thickly membranous or papery, smooth and shining on both sides, nerves slightly prominent on both sides, pinnate, one on each side from close to the base, and often one marginal: petioles 2.5-7 cm. l., tomentose; styles cleft halfway.

Dolphin Head, Harris! Fl. Jam. 10,283, 10,306.

Tree 20-30 ft. high. Young twigs, inflorescence, parts of flowers, capsules tomentose. Inflorescence to more than 3 dm. l. with long peduncle. Male inflorescence paniculate, branches very short or wanting, so that the flowers are clustered. Pedicels 2-7 in each cluster, to 8 mm. 1. Calyx unopened globular, 2-3 mm. in. diam. splitting into five segments 3.5-4 mm. l. Stamens about 17 or 18. Female inflorescence racemose with flowers solitary, distant. Fruiting calyx about 2 mm. 1. Capsule 5 mm. l. Seeds olive-grey, 3 mm. in diam.

3. L. Harrisii Britton in Bull. Torr. Bot. Club xli. 16 (1914); leaves 6-15 cm. l., elliptical, shortly and acutely acuminate, base obtuse, papery-leathery, puberulous on nerves on both sides, otherwise glabrous on upper surface, tomentose and soft to the touch beneath, nerves and veins slightly prominent on both sides, nerves one on each side at base marginal, one somewhat near base; petioles 1-2 cm. l., tomentose; styles cleft halfway.

Peckham, Clarendon, 2,500 ft., Harris! Fl. Jam. 11,192.

Tree 25 ft. high, apparently diœcious. Youngest portions of twigs, inflorescence, parts of flowers, and capsule tomentose and soft to the touch, leaves crowded at the apex, twigs stout, marked with large prominent scars of fallen leaves. Male flowers not seen. Female racemes more or less erect, to 10 cm. l. Pedicels 1-1.5 cm. l. Fruiting calyx to 3 mm. l. Capsule 5 mm. l., 7 mm. br. Seeds ellipsoidal-globular, pinkishgrey marked with minute white dots, about 3 mm. 1.

13. ALCHORNEA Sw.

Trees or shrubs. Leaves alternate, 3-5-nerved and glandular at the base. Flowers diecious or monecious, without petals, in axillary or lateral spikes or racemes; the male spikes slender, simple or paniculate, with small flowers clustered along the rhachis, the female spikes or racemes simple, with a single flower under each bract. Disk generally wanting. Male flowers: Calyx globose and closed in the bud, valvately 4-(3-2-)parted during flowering. Stamens 8 or fewer, united at the base to form a saucer-shaped membrane. Rudiment of ovary none. Female flowers: Segments of perianth 4 (3-6), imbricate. Ovary 2(-3)-celled; styles 2(-3) distinct, undivided or rarely 2-lobed, long-exserted; ovules solitary. Capsule splitting into two (or three) 2-valved cocci. Seeds subglobose, without a caruncle.

Species about 60, natives of the tropics.

A. latifolia Sw. Prodr. 98 (1788) & Fl. Ind. Occ. 1154, t. 24; Jussien Euphorb, Tent. 42, t. 13, f. 41; Hayne Arzneyk, x. t. 42;

A, Leaf and male inflorescence × 3. B, Male flower with two anthers removed D. Small portion of female inflorescence

C, Ditto seen from below × 3.

E, Ovary of female flower cut lengthwise

Tree 20-40 ft. high. Leaves 1-3 dm. l., elliptical or ovate, apiculate, bluntly glandular-dentate, leathery, 3-nerved at base, nerves beneath very prominent. Spikes to 2 dm. l.: male paniculate, female simple, solitary or two together. Male flowers, in bud, globular, about 2 mm. in diam. Female flowers: Styles shortly united at base, to 1.5 cm. l. Capsule brownish-red, 7 mm. l., 9-10 mm. in diam.

14. ACALYPHA L.

Herbs, shrubs or small trees. Leaves alternate, pinnate-veined, sometimes 3-5-nerved from the base, generally serrate and long-stalked. Flowers monecious, but A. scabrosa diecious, without petals; male flowers small, clustered in the axil of small

bracts, arranged in spikes, catkin-like or slender and elongated; female solitary or 2-4 together in the axil of a leafy bract; female bracts increasing in fruit, solitary or few at the base of the male spikes, sometimes in a distinct spike; male and androgynous spikes mostly axillary; female axillary, lateral, or terminal, solitary or clustered. Disk wanting. Male flowers: Calyx closed in the bud, valvately 4-parted in flowering. Stamens S(-16); filaments free; anther-cells free, hanging from the apex of the filament, usually flexuose, worm-like, opening at the apex. No rudiment of ovary. Female flowers: Sepals 3-4, imbricate. very small. Ovary 3-celled; styles 3, free, thread-like, generally much branched; ovules solitary. Capsule splitting up into three 2-valved cocci. Seeds without a caruncle.

Species, about 370, widely dispersed through the tropics, a very few beyond the tropics in America.

Inflorescence 2-sexual (see also A. virgata).

Leaves roundish to oblong-lanceolate, 1-3 cm. l.

Perennial herb, stems to 1 ft., woody often below.....

Leaves ovate acuminate, 4-8 cm. l. Shrub, 2-4 ft. 2. A. cuspidata.

Inflorescence 1-sexual. Female bracts few. Shrub 1-6 ft., diœcious 3. A. scabrosa.

Female bracts many. Plants monœcious. Female spike terminal. Annual herbs.

Female spike plume-like; bract with long

bristle-like apex 4. A. alopecuroidea. Female spike not plume-like; bract to 2 mm. l.

Female spike axillary. Shrubs or small trees.

Fruiting bracts 5-9 mm. l. Leaves crenate-serrulate.

Young twigs, petioles, and inflorescence puberulous. Fruiting bracts to 8 mm. l., notched to $\frac{1}{3}$ or $\frac{1}{4}$ of its length into triangular-deltoid teeth 6. A. virgata.

Glabrous. Fruiting bract cleft below middle.

Fruiting bract with lanceolate-linear lobes Fruiting bract with oblong obtuse lobes S. A. pruinosa.

Leaves strongly serrate. Young twigs, petioles, and inflorescence densely pubescent 9. 1. jomaicensis.

Fruiting bract less than 5 mm. l. 10. A. elliptica.

1. A. chamædrifolia Muell. Arg. in DC. Prodr. xv. pt. 2, 879 (1866) (excl. vars.); herb, perennial, often woody below; leaves roundish to oblong-lanceolate, 1-3 cm. l.; inflorescence 2-sexual; Urb. Tap-root thick, woody, growing vertically or at various angles. Stems, sometimes with rhizomes more or less horizontal, woody at base, erect to spreading-procumbent, to 1 ft. long or high; branches villose, especially on young parts. Leaves: margin crenate, nerves pinnate, one on each side from the base, membranous, more or less pubescent; petiole 2-10 mm. l., villose; stipules small, lanceolate. Spikes 1-3 cm. l., terminal and in axils of upper leaves, the portion above with male flowers deciduous, 4-8 female bracts below, crowded; rhachis villose. Male bracts linear, pubescent, ·6-1 mm. l. Fruiting bracts about 3 mm. l., divided one-third

of the way down into about 7 to 9 triangular lobes, villose outside, enclosing two flowers, one developing before the other. Capsule 3-lobed-globular, villose on upper part, 1.6 mm. l. Seeds dark brown, ellipsoidal, 1-1.2 mm. l.

2. A. cuspidata Jacq. Hort. Schoenbr. ii. 63, t. 243 (1797); shrub; leaves ovate, acuminate, 4–8 cm. l.; inflorescence 2-sexual. —Griseb. Fl. Br. W. Ind. 48. A. cuspidata var. genuina Muell. Arg. in DC. Prodr. xv. pt. 2, 858 (1866).

Cuba, Hispaniola, S. Vincent, tropical S. America.

Shrub 2-4 ft. high; tomentose on young parts. Leaves 4-8 cm. l., ovate, acuminate, base slightly cordate, crenate-serrate, nerves pinnate, with three on each side from the base, usually softly tomentose to the touch or glabrate, pubescent on the nerves; petfole 1·5-3 cm. l., tomentose or pubescent; stipules linear, broader at base, to 6 mm. l., soon falling. Spikes 2-sexual, axillary, somewhat longer than the petiole, 2-4 cm. l., male flowers numerous with 1 to 3 female flowers at base; rhachis villose-tomentose, hairs often glandular. Fruiting bracts entire, slightly uneven, somewhat rounded in outline with cordate or truncate base, about 2 mm. in diam., tomentose outside and on the margin, enclosing two flowers. Capsule 3-lobed-globular, villose, with a few glandular hairs, nearly 2 mm. l. Seeds ellipsoidal, covered with minute projecting points, about 1·2 mm. l.

3. A. scabrosa Sw. Prodr. 99 (1788) & Fl. Ind. Occ. 1175; inflorescence 1-sexual, diocious; female bracts few; shrub.—

Wright! Broughton! Swartz! Macfadyen! Ocho Rios, McNab! Port Royal Mts., Purdie! Wilson! St. Ann's Bay; Ocho Rios; Liguanea Hills; Prior! Liguanea plain, 600-650 ft., Campbell! Blue Mts.; Long Mt.. 200-300 ft.; Yardley Chase, 1600 ft.; Constant Spring to Bardowic, 800 ft.; Harris! Hectors River, Harris & Britton! Bog Walk, Britton, 2626: Fl. Jam. 5158, 5601, 5750, 5908, 6256, 8924, 9578, 9669, 10,717, 12,104.

Shrub 1-6 ft. high, erect or with branches trailing over rocks, diocious, rarely monoecious. Branches numerous, pubescent. Leaves variable in size, form and hairiness, '5-8 cm. l., narrowly elliptical to elliptical-roundish, ovate or lanceolate, apex rounded to acute or sub-acuminate, base rounded to wedge-shaped, serrate or crenate, nerves pinnate, one on each side at base, papery, pubescent or glabrescent on nerves, surface glabrous or tomentose; petiole 1 mm.-1 cm. l., pubescent or glabrous; stipules small, very soon falling. Spikes axillary: male '5-2'5 cm. l., with numerous flowers; female to '5 cm. l., with three or four bracts. Fruiting bracts 4 mm. l., with 4-10 triangular unequal acute teeth or lobes, usually about one-third length of bract, villose and ribbed outside, enclosing one or two-towers. Capsule 3-lobed-globular, villose on upper part, about 1'7 mm. l. Seeds brown, ovate-ellipsoidal, about 1'4 mm. l.

There are two well-marked forms, one with leaves oblong-lanceolate, serrate, more or less hairy (A. scabrosa Sw.), the other with leaves roundish to elliptical, crenate, glabrous except on nerves (A. betulæfolia Sw.); but these forms are connected by intermediates. A form with blunt ovate glabrescent leaves is A. scabrosa, var. ovata Griseb., one with elongated lanceolate softly hairy leaves is var. elongata Urban.

4. A. alopecuroidea Jacq. Collect. iii. 196 (1789) & Ic. Pl. Ror. iii. t. 620; annual herb; inflorescence 1-sexual; female spike terminal, plume-like, sometimes apparently axillary through shortness of branch, with a bristle-like appendage at the apex about 1 cm. l., tipped with an abortive flower; fruiting bract divided into 3-5 segments 7-10 mm. l., triangular-ovate at the base, apex long, bristle-like.—Willd. Sp. Pl. iv. 526; Muell. Arg. tom. cit. 882; Millspaugh in Field Columb. Mus. Bot. ii. 58, 156; Britton in Bull. Torr. Bot. Cl. xli. 12.

A weed, Hope, near Porus, 1150 ft., Harris! Fl. Jam. 8210.—Bahamas, Cuba, Cayman Is., Hispaniola, Porto Rico, Grenada, Mexico, Honduras,

Guatemala, Panama, Colombia, Venezuela.

Recots much branched, fibrous. Stem erect, branching from near the woody base, 7 in. to 1½ ft. high, branches pubescent. Leaves 2-4(-7) cm. l., ovate, with a short narrow acuminate apex, base rounded or truncate, serrate, nerves pinnate, generally two on each side from the base, membranous, usually glabrous, sometimes sparingly pubescent; petiole generally as long as the leaf, 2-3(-4) cm. l.; stipules small, linear-lanceolate. Spikes: male axillary, very short, 3-9 mm. l.; female '5-2 cm. l. Fruiting bracts enclosing one capsule, membranous, covered with hairs, some long, 1'5-2 mm. l., some glandular, short. Capsule 1'3-1'4 mm. l. Seed ellipsoidal, about 1 mm. l.

5. A. corchorifolia A. Rich. in Sagra Cub. xi. 203 (1850) (non Willd.); herbaceous annual; inflorescence 1-sexual, male and female on the same branch, female usually terminal, somewhat lax-flowered; fruiting bract about 2 mm. 1., divided to near the middle into about twenty oblong acute lobes.—

A. polystachya Griseb. Fl. Br. W. Ind. 48 (1859) (non Jacq.).

St. Elizabeth, Wullschlaegel.—Cuba, Porto Rico, Mexico. A specimen from the "West Indies" named A. corchorifolia by Swartz is in Herb.

Stockholm.

Smoothly puberulous on young twigs and petioles. Leaves 3.5–7 cm. 1., ovate, acuminate, base slightly cordate, serrate, membranous, nerves two on each side from the base, and a supplementary one, puberulous; petiole nearly as long as the leaf. Spikes: male slender, axillary, to 1.2 cm. 1., with peduncle about as long as spike; female occasionally in axils of upper leaves, 4–5 cm. 1. Female bract 1-flowered, rough. Capsule about 2.5 mm. 1., rough with tubercles. Seeds grey, rough and wrinkled, ovate-globular, 2 mm. 1.

6. A. virgata L. Syst. ed. 10, 1275 (1759) & Amorn. v. 410, 383 (the reference on p. 383 of the specific name to Browne's

No. 1 instead of No. 2 is evidently a mistake which has been copied into Sp. Pl. ed. 2); shrub, with youngest part of twigs. also the petioles, and peduncle with rhachis of inflorescence, puberulous, at length glabrate; leaves crenate surrulate; inflorescence unisexual (or the male spike rarely with one female bract near the base), female spike axillary; fruiting bracts many, 7-9 mm. l., notched to about \(\frac{1}{3} \) or \(\frac{1}{4} \) of its length into 7-9 triangular-deltoid teeth or lobes.—Sw. Fl. Ind. Occ. 1169: Griseb. Fl. Br. W. Ind. 47; Muell. Arg. in DC. Prodr. xv. pt. 2, 816. A. erecta virgultosa &c. Browne Hist. Jam. 346, t. 36, f. 2. Type, Browne's specimen, in Herb. Linn.; there is also a specimen from Browne in Herb. Mus. Brit.

Browne! Wright! Swartz! Macfadyen! Purdie! Wilson! March; J.P. 1116, 1159, Morris! Woodcutters Gap; Clydesdale, 3600 ft.; Harris! Fl.

Jam. 5247, 5467, 5507.

Shrub 10-15 ft. high, monœcious. Leaves 5-15 cm. l., elliptical to narrowly oblong-elliptical, acuminate, base obtuse or subcordate, glabrate, nerves pinnate, veins distinct, especially beneath, membranous; petiole 5-4 cm. l. Spikes axillary, pedunculate, male and female usually on different branches, sometimes on the same branch, when the male is on younger wood than the female; male 5-10 (3-14) cm. l., female 4-6 (3-7.5) cm. 1., with 5-10 bracts or clusters of two or three at intervals. Male bracteoles ovate. Female bracts hispidulous on and just below margin on inner side, enclosing one or two flowers. Capsule about 2 mm. 1., puberulous. Seeds ovate-ellipsoidal, about 1.8 mm. l.

Var. pubescens Fawc. & Rendle in Journ. Bot. lcii. 314 (1919): young branches, petioles, midrib and nerves densely pubescent; leaves sparingly pubescent on both sides; petioles 2-8.5 cm. l.: female spikes to 8 cm. l.; female bracts hispidulous on margin and outer surface. Type in Herb. Kew and in Herb. Jam.

7. A. lævigata Sw. Prodr. 99 (1788) & Fl. Ind. Occ. 1166: shrub, glabrous, but puberulous on very young leaves, ovary, and capsule; leaves crenate-serrulate; inflorescence unisexual, female spike axillary; fruiting bracts many, 6 mm. l., cleft to below the middle into about seven lanceolate-linear lobes,— Grisch. Fl. Br. W. Ind. 48; Muell. Arg. in DC. Prodr. xv. pt. 2, 820. Type from Swartz in Herb. Stockholm and a specimen also in Herb. Mus. Brit.

Shakspear! in the western parts, Swartz! Macfadyen; Christiana, Manchester, Purdie! Wilson; Tyre, near Troy, 2000 ft.; slopes of Dolphin Head Mt.; Peckham, Clarendon, 2500-2800 ft.; Ipswich, St. Elizabeth. 500-750 ft.; Harris! Fl. Jam. 9470, 10,290, 10,862, 12,504.

Shrub 2-6 ft. high, glabrous (but puberulous on very young leaves, ovary, and capsule); monoccious. Leaves 5-8 (3-11) cm. l., lanceolate to narrowly elliptical, shortly acuminate, base cuneate, emarginate, margin crenate-serrulate, nerves pinnate, papery; petiole short, 2-7 mm. 1. Spikes unisexual, axillary, to 8 or 10 cm. 1., male and female spikes on young wood, generally on same branch, the male usually on youngest wood, and sometimes as long as 17 cm. l.; male flowers dense, female several to 20 at intervals. Male bracteoles elliptical-oblong. Female bracts enclosing two flowers, white tinged (in dried plants) with purplish-red, about 2 mm. l., increasing to 6 mm. in fruit, divided to below the middle into lanceolate-linear lobes, the middle one longest. Ovary puberulous. Styles (in dried plants) purplish, pinnate with many branches. Capsule about 3 mm. l., puberulous.

8. A. pruinosa *Urb. Symb. Ant. v.* 388 (1908); shrub, glabrous; leaves crenate-serrulate; inflorescence unisexual, female spike axillary; fruiting bracts many, 8 mm. l., cleft about two-thirds of length into 4-7 oblong obtuse lobes.

Woods near Resource, Purdie! near Troy, 2000 ft.; Lapland, near

Catadupa, 2000 ft.; Harris! Fl. Jam. 8738, 9175.

Shrub 8 ft. high, monœcious; glabrous. Leaves 9-15 (7-20) cm. l., 2-5 cm. br., narrowly elliptical, apex usually acuminate, base subcordate or obtuse, crenate-serrulate, pinnately nerved, papery; petiole '5-5 cm. l., glandular at the apex on the upper side; stipules ovate-lanceolate, reddish, somewhat thick, 5-7 mm. l. Spikes unisexual, male on branches more than one year old, female on branches less than one year old, male 3-10 (or more) cm. l., slender, female, 3-5 cm. l. Female bracts 1-flowered, 2-4 mm. l., increasing in fruit to 8 mm. l. Capsule about 2·5 mm. l., hirtellous.

9. A. jamaicensis Britton in Bull. Torr. Bot. Club xxxix. 7 (1912); shrub, with twigs, petioles, and inflorescence densely pubescent; leaves strongly serrate; inflorescence unisexual, temale spike axillary; fruiting bracts many, 5 mm. l., divided about halfway into 5-9 oblong-ovate lobes.

Masson! Purdie! Leicesterfield, Clarendon, 1800 ft.; Toms Cave Wood,

Clarendon, 2500 ft.; Harris! Fl. Jam. 10,842, 10,856.

Shrub 6-8 ft. high, monœcious. Leaves variable in size, 5-18 cm. l., 2-5.5 cm. br., elliptical-lanceolate or oblong-lanceolate, with a long slender acuminate point, base subcordate, nerves pinnate with 1 or 2 on each side from the base, membranous, sparingly pubescent on both sides, denser on nerves beneath, or glabrate above; petiole 1-4 cm. l.; stipules minute, soon falling. Spikes: male and female on same or different branches, male to 10 cm. l. (with peduncle 2 cm. l.), female 5-10 cm. l. (with peduncle 1.5-5 cm. l.). Male bracts linear, somewhat flat, hirtellous, 2-3 mm. l. Female bracts hirtellous on margin and on the prominent ribs, generally enclosing two flowers, one developing before the other. Capsule about 1 mm. l., hirtellous.

10. A. elliptica Sw. Prodr. 99 (1788) & Fl. Ind. Occ. 1168; shrub or tree, with twigs, petioles, and inflorescence puberulous or glabrous; leaves crenate-serrate; inflorescence axillary, unisexual, male and female on the same or different branches; fruiting bracts many, to 3 or 4 mm. l., transversely elliptical, somewhat cordate at base, margin uneven, shortly toothed.—Griseb. op. cit. 47; Muell. Arg. tom. cit. 812; Urb. Symb. Ant. v. 388. A. hernandifolia Sw. Prod. 99 (1788) & Fl. Ind. Occ. 1162; Griseb. loc. cit.; Muell. Arg. tom. cit. 808; Urb. loc. cit. A. villosa

Griseb. loc. cit. (non Jacq.). A. Alexandri Urb. tom. cit. 387 (1908). Specimens from Swartz of A. elliptica and A. hernandifolia are in Herb. Stockholm, and of A. elliptica in Herb. Mus. Brit. Type of A. Alexandri is in Herb. Kew.

Wright! Broughton! Dancer; Shakspear! Masson! Swartz! Pardie! Wilson! Ocho Rios; Union Hill and Pleasant Valley, Moneague; Prior! J.P. 1132, Morris! David's Hill; New Market, 1150 ft.; Harris! above Lucea, Mrs. E. G. Britton 2874! Fern Gully, Britton & Hollick 2692! Fl. Jam. 5123, 9838, 9881.

Plant 10-15 ft. high, monœcious or diœcious. Leaves 6-15 cm, 1., broadly ovate, ovate, ovate-elliptical, or elliptical, more or less acuminate. base rounded to subcordate, nerves pinnate with one on each side from the base which often reaches halfway up the limb, and sometimes with another marginal, membranous; petiole variable in length, 1-15 cm. l. Spikes 5-16 cm. l., 1·5-2·5 mm. in diam., female lax, with the bracts sometimes 1·5 cm. apart. Female bract with one flower. Capsule 3-lobed-globular, 1·5-2·5 mm. l., hispid. Seeds 1·5-1·2 mm. l., roundish-ovateellipsoidal, blackish.

15. ACIDOTON Sw.

Shrub or small tree, loosely branching; with stinging hairs especially on margin of leaves, calyx, and capsule, otherwise somewhat glabrous. Leaves alternate, entire, leathery, pinnatenerved. Inflorescence axillary. Flowers monecious or diecious, without petals, solitary in the axil of a bract. Male racemes shortened so that the flowers are clustered, flowers with long pedicels. Female racemes longer, pendulous, flowers solitary in the axil of a bract, distant along the rhachis. Disk none or not conspicuous. Male flowers: Sepals 3-5, valvate, reflexed in flower. Stamens numerous, indefinite, on a receptacle which is raised, cup-shaped above with fleshy walls in A. ureus, fleshy and somewhat flat in A. microphyllus. Rudiment of ovary none. Female flowers: Sepals 5-6, imbricate, erect in flower. Ovary 3-celled: styles united at the base into a thick column, entire above or slightly 2-lobed; ovules solitary. Capsule splitting up into three 2-valved cocci. Seeds without a caruncle; endosperm fleshy; cotyledons flat, broad.

Species 2, one a native of Jamaica, the other of Hispaniola.

- Anthers, back and front \times 10.
- D, Female flower \times 4. E, Coccus, nat. size. F, Seed \times 1\frac{1}{2}.

Sepals about 6 mm. l. Anther-cells parallel dehiscing outwards, connective terminated by a cluster of very short hairs. Female flowers: Pedicels 1-2 mm. l. Bracteoles 5-6 mm. l. Sepals about 5 mm. l., narrower than in the male. Styles bending outwards, covered on the inner side with white fleshy hairs. Capsule 1.5 cm. in diam., 6-7 mm. high, black, covered with white stinging hairs. Seeds globular, about '5 cm. in diam., brown with white spots.

16. TRAGIA L.

Climbing or twining perennial herbs or undershrubs, generally hispid or rough with hairs which are often stinging. alternate, toothed, often cordate, pinnate-nerved, with one or

two on each side at the base, with stipules. Flowers monœcious, without petals. Racemes axillary (in T. volubilis) usually with male and female flowers, the latter at the base. Flowers usually solitary in the axil of a bract. Male flowers: Calyx globose, closed in bud, valvately 3-(5-)parted in flowering. Disk none or obscure. Stamens 3, 2 or 1. Rudiment of ovary none or minute. Female flowers: Sepals usually 6, imbricate. Ovary 3-celled; styles 3, united into a column, undivided at the apex; ovules solitary. Capsule splitting up into three 2-valved cocci. Seeds without a caruncle; endosperm fleshy; cotyledons broad, flat.

Specimens over 100, widely dispersed through the tropics, and extending to South Africa and the southern states of North America.

T. volubilis L. Sp. Pl. 980 (1753) & Amæn. v. 382; Sw. Obs. Bot. 353; Griseb. Fl. Br. W. Ind. 48; Muell. Arg. in DC. Prodr. xv. pt. 2, 935; Urb. Symb. Ant. iv. 348; Prain in Fl. Trop. Creeping or Twining Cowitch.

Near St. Jago de la Vega, and common elsewhere, Sloane Herb. ii. 72! Houstoun! Lane in Herb. Sloane clxii. 126! Browne! Wright! Broughton! Shakspear! Masson! Distin! near Holland Bay, Purdie! Wilson! Mammee Bay; Kingston; Prior! March! Port Morant, Hitcheock; Cherry Garden, Liguanea plain, Campbell; Hope grounds and river; near Browns Town, 1000 ft.; Round Hill, St. Cruz Mts.; Harris! Fl. Jam. 5832, 6770, 7058, 8284, 9697.—West Indies, Curaçao, tropical continenta! America. West Africa.

Shrub; branches trailing and twining over shrubs, armed with stinging hairs. Leaves 2-6 cm. l., oblong-lanceolate or oblong, base truncatecordate or rounded, serrate, more or less hirsute with pellucid hairs, which soon drop off; petiole 5-3 cm.l.; stipules lanceolate, about 3 mm.l. Racemes slender, 3-7 mm.l.; bracts lanceolate, persistent, 1 mm.l., female sometimes lobed; male flowers numerous, female usually 1 (3-4); pedicels of male flower about 3 mm. l., jointed about halfway, of female flower continuing to grow until the capsule is ripe, looking like a branch of the raceme, 1.5-3 cm. 1., jointed below the apex. Male flowers: Calyx about 1.2 mm. 1. Sepals 3. Female flowers: Calyx about 2 mm. 1. Sepals 6. Ovary hispid. Capsule 3.5 mm. high, about 7 mm. in diam., hispid with white hairs, deeply divided into 3 subglobular cocci. Seeds globular, 2.5 mm, in diam.

The root is looked upon as a good aperient and diuretic, and both the

decoction and juice are frequently used for those purposes (Browne).

17. RICINUS L.

A tall annual glabrous herb, or in warm regions an arborescent shrub. Leaves alternate, peltate, palmately divided into seven or more serrate lobes. Stipules united to cover the bud. Flowers monœcious, without petals. Racemes more or less paniculate at the ends of branches, the lower flowers male, the upper female. Disk none. Male flowers: Calyx globose in bud, valvately 3-5-parted in flowering. Stamens very numerous with much branched filaments; anther-cells subglobose, separately attached to the connective. No rudiment of an ovary. Female flowers: Calyx splitting into the form of a spathe, falling very early. Ovary 3-celled; styles 2-cleft; ovules solitary in each cell. Capsule splitting up into three 2-valved cocci, spiny or smooth. Seeds with caruncle conspicuous.

Species 1, very widely spread throughout the warmer regions of the world, perhaps originally African, often culti-

vated.

Cultivated and spontaneous; Sloane Herb. ii. 93! and Carp. Coll.! Lane in Herb. Sloane clxii. 121! Hope Gardens, Harris!—For distribution see under genus.

Leaves 1.5-6 dm. broad; petiole 1-3 dm. l. Male flowers 12-15 mm. in diam. Female calyx about 8 mm. 1. Capsule 1.3-2.4 cm. 1., ellipsoidal.

Seeds flattish-ellipsoidal, 10-17 mm. l. (without the caruncle).

The seeds yield the castor-oil of commerce. The oil-cake is a valuable manure. See Barham, Hortus Americanus, 120, 144; Watt Comm. Prod. Ind.; Bull. Dept. Agri. Jamaica n.s. ii. 50 (1912).

[MANIHOT Adans.

Tall herbs or shrubs. Leaves alternate, with three to seven digitate lobes or segments, sometimes entire. Flowers large for the Family, monecious, without petals, one in axil of each bract, in racemes. Racemes terminal or in the upper axils, sometimes branching, lax, the upper flowers male, the female generally at the base of the raceme. Calvx often coloured, campanulate, with five imbricate lobes. Male flowers: Stamens 10, in two series, attached between the lobes or glands of the disk; anthers dorsifixed. Rudiment of ovary wanting or small, 3-lobed. Female flowers: Disk hypogynous. Ovary 3-celled; styles shortly united at the base, spreading, many-lobed; ovules solitary. Capsule splitting up into three 2-valved cocci. Seeds smooth, with large caruncle.

Species 128, all American, mostly Brazilian, a few dispersed through the tropical regions as far north as Mexico, one or two

cultivated for many years in various tropical lands.

M. utilissima Pohl Plant. Bras. i. 32, t. 24 (1827); Muell. Arg. in DC. Prodr. xv. pt. 2, 1064 & in Fl. Bras. xi. pt. 2, 457, t. 65; Urb. Symb. Ant. iv. 350; Pax in Engl. Cassava or Cassada, Tapioca, Manioc. Sloane Herb. ii. 98, 991 cult., Broughton! cult., Harris! Fl. Jam. 5606, 7703, 7719. Cultivated throughout the tropics and in subtropical

regions, e.g. Florida, Bermuda, probably indigenous in Brazil.

Root tuberous, elongated, full of starch, with juice which is sometimes bitter and poisonous. Shrubby, sometimes arborescent, 5-9 ft. high. Leaves deeply 3-7-parted, membranous, on upper surface glabrous, beneath glaucous and minutely puberulous or glabrous along the nerves; lobes 8-15 cm. l., lanceolate, entire; petiole generally longer than the leaf; stipules linear, acuminate, entire, 6-7 mm. l. Inflorescence branching from the base, primary branches 3-5 cm. l. Flowers glabrous except the apex of the connective which has a cluster of hairs. Male flowers: Calyx 5-cleft, glabrous outside, puberulous inside, 3-4 mm. l. Female flowers: Calux 5-parted, 9-10 mm. 1., glabrous. Ovary 6-ribbed, glabrous. Styles

(C-G, after Tussac.)

broadening out from the narrow base, and cut along the upper edge into numerous lobes. Capsule about 1.5 cm. 1., broadly ellipsoidal, rough, narrowly winged. Seeds about 12 mm. 1., grey mottled with dark splashes. The tuberous roots may be roasted or boiled directly after digging, or, if kept longer, they are grated, and the juice squeezed out by pressure.

The material left in the press is pounded and dried on hot iron plates, forming cassava meal, which is made into cakes. Pure cassava starch is a valuable commercial article used in Manchester goods. Moistened and dried on hot plates it forms tapioca. The juice of the bitter cassava heated to get rid of the poisonous principle, is an antiseptic, the basis of many sauces, and boiled with peppers and meat forms "pepper-pot." See also Barham, Hortus Americanus, 34; Watt Dict. Econ. Prod. Ind. & Comm. Prod. Ind.; Bull. Bot. Dept. Jam. n.s. ix. 81 (1902); Bull. Dept. Agriculture, Jamaica i. 35 (1903), & n.s. i. 53, ii. 186.]

18. JATROPHA L.

Tall herbs, or shrubs, rarely arborescent. Leaves alternate, undivided or (sometimes in the same plant) digitately lobed or cleft; segments 3 to numerous, margin entire or wavy or pinnately lobed. Stipules small or cut up into threads. Flowers monœcious, with petals in Jamaican species, numerous in terminal, corymb-like panicles regularly forked, the female flowers solitary in the primary forks. Male flowers: Calyx, segments or lobes 5, imbricate. Petals 5, contorted-imbricate, united into 5-lobed corolla, or distinct, or wanting if the calyx is petaloid. Disk entire or of five glands. Stamens 10 or fewer, attached to the receptacle in two or several series; filaments, at any rate the interior, more or less united into a column, the 5 exterior opposite the petals. No rudiment of an ovary. Female flowers: Calyx like that of the male. Petals present in Jamaican species, sometimes wanting in others. Ovary generally 2–3-celled; styles united at the base, divided each into two stigmatic lobes or branches; ovules solitary. Capsule splitting up into two or three 2-valved cocci. Seeds carunculate.

Species about 150, natives of the tropics, especially in America, but extending also into North America and southern

Africa.

1. J. curcas L. Sp. Pl. 1006 (1753) & Amæn. v. 383; leaves not, or slightly, lobed, roundish-ovate, apex acute, base widely cordate, entire, glabrous or sometimes puberulous at the base beneath. 5-1.5 dm. l., lobes acute to rounded; cymes corymbose,

Branches of fork not diverging. Leaves peltate 5. J. hernandixfolia.

Sloane Herb. ii. 94! Houstoun! Lanc & Pasmore in Herb. Sloane

clxii. 122! Wright! Parnell! Moneague, Prior! Robertsfield, 3000 ft., Harris! Fl. Jam. 7666.—Bermuda, West Indies, tropical continental America, cultivated and subspontaneous in the tropics of the Old World.

Shrub, sometimes tree-like, 5-20 ft. high. Trunk to 3 dm. in diam., with copious milky juice. Branches stout, with chambered pith. Petiole 5-1·5 dm. l., with the branches glabrous. Stipules very rudimentary, tomentellous. Bracts lanceolate, 3-14 mm. l. Male flowers: Calyx 3·5-4·5 mm. l., sepals united at the base, narrowly elliptical. Petals 6·5 mm. l., elliptical, cohering as far as the middle, pubescent within. Disk-glands free. Filaments 9, five inner united halfway, four outer united at the base. Female flowers: Calyx like the male, but half as long again. Petals like the male, increasing with calyx in fruit. Disk-glands free. Ovary glabrous. Styles very short, with 2-lobed stigmas. Capsule fleshy on outside at first, with three or two cocci, 2·5-4 cm. l. Seeds blackish, oblong-ellipsoidal, about 2 cm. l.

This species is sometimes used as a hedge by small settlers, as slips grow quickly. The oil expressed from the seeds is purgative and emetic; it is applied in diseases of the skin. See Barham, Hortus Americanus, 141;

Shrub 2-3(-6) ft. high. Petiole as long as, or shorter than, the limb, bearing glandular branching hairs. Stipules cut into thread-like glandular segments, 3-5 mm. l. Bracts linear-lanceolate, glandular-ciliate, 5-1 cm. l. Flowers purple. Sepals acuminate, lanceolate in male, lanceolate to ovate in female, glandular-ciliate, pubescent outside, persistent in fruit, male 3-3·5 mm. l., female 4·5-5 mm. l. Petals free or slightly cohering at base, glabrous, elliptical narrowing to base, about 4 mm. l., of female deciduous. Disk-glands of male flower free, roundish, of female lobed. Filaments 10-12, united above the middle, many times longer than the anthers. Ovary puberulous. Styles slender, free; stigma 2-lobed. Capsule about 1 cm. l. and br., globular-oblong, truncate at both ends, slightly 3-furrowed, glabrous. Seed greyish-brown, slightly mottled, 7-8 mm. l.

Sloane says: "This is the most general [purgative] remedy of the poorer sort in the dry belly-ache; they take of the leaves from seven to twenty-one, and boil them, drinking the decoction." Poultry are fond of the seeds. See Barham, Hortus Americanus, 19.

3. J. multifida L. Sp. Pl. 1006 (1753) & Amæn. v. 383; leaves palmately deeply lobed, glabrous, lobes generally 11(-7), 1-1·5 dm. l., lanceolate, narrowed into a long tail at apex with 1-3(-5) smaller lobes on each side, much lighter and more or less pruinose beneath.—Wright Mem. 219; Sw. Spanish, or French Physic Nut.

(Sloane, Barbados, Herb. ii. 95! and Carp. Coll.!) Browne! Wright! Liguanea, Broughton! Parnell! Lucea, Hitchcock; cultivated and apparently indigenous in Jamaica and West Indies generally, continental tropical and subtropical America, cult. and subspontaneous in trop. Africa and S.E. Asia.

Small tree or shrub, 5–20 ft. high. Branches glabrous. Leaves palmately deeply lobed, glabrous; lobes generally 11(-7), 1–1·5 dm. l., lanceolate narrowed into a long tail at apex, with 1–3(-5) smaller lobes on each side, much lighter and more or less pruinose beneath. Petiole 1-2 dm. l., glabrous. Stipules cut into thread-like, glabrous segments, 1–2 cm. l. Cymes corymb-like, glabrous; peduncle 2–1 dm. l. Bracts linear-lanceolate, glabrous, 1·5–2·5 mm. l. Pedicels jointed at the apex. Flowers scarlet, glabrous. Male flowers: Calyx 2–2·5 mm. l.; segments about half as long, with rounded apex, of a pale coral colour. Petals 4–6 mm. l. Disk of five glands united at the base. Filaments 8, red, free to the base; anthers long. Female flowers: Calyx and petals as in male, petals to 6 or 7 mm. l. Ovary glabrous. Styles short, united in the lower half, with thick 2-lobed stigmas. Capsule yellow, with a longitudinal slight ridge on back of the cocci, 2–3 cm. l. and br. Seeds mottled, broadly ellipsoidal, about 2 cm. l.

See Barham, Hortus Americanus, 141.

[J. podagrica Hook. Bot. Mag. t. 4376 (1848); Muell. Arg. in DC. Prodr. xv. pt. 2, 1093; Pax tom. cit. 44.

Naturalized in waste places in the lowlands, cult. in Hope Gardens, Harris! Fl. Jam. 12,709.—Central America and northern S. America,

also cultivated in many of the West Indian islands.

Stem, 1-13 ft. high, and branches distorted, swollen at their bases, succulent, pale greenish-brown; trunk and branches marked with the scars of the fallen leaves. Leaves peltate, 3-6-lobed, base sometimes somewhat flattened, glabrous; 6-22 cm. in diam., only a few appearing at a time at the apex of the branches; petioles usually as long as the leaf; stipules with glandular fringe, persisting for some time after the fall of the leaf. Cymes compact, corymb-like; peduncle long. Flowers orange-scarlet, rather small, female solitary at the forks, male numerous at the ends of the branches. Male flowers: Callyx exceeding 2 mm. l., lobes rounded, about 7 mm. l. Petals oblong-elliptical, apex rounded, 7 mm. l.

Disk cup-shaped. Stamens 8-6; filaments free to base; anthers long, 3 mm. l. Female flowers: Calyx and petals like those of male. Ovary glabrous. Styles short with thick 2-lobed stigmas. Capsule about 1.5 cm. l., ellipsoidal. Seeds 12 mm. l., light-brown.]

J. panduræfolia Andr. Bot. Rep. iv. t. 267, a native of Cuba, is cultivated in gardens; it is a shrub about 6 ft. high, with fiddle-shaped

leaves, and large, handsome, crimson flowers.

4. J. divarieata Sw. Prodr. 98 (1788) & Fl. Ind. Occ. 1158; Griseb. loc. cit.; Muell. Arg. tom. cit. 1077; Pax tom. cit. 74. Specimens from Swartz in Herb. Mus. Brit. and in Herb. Stockholm.

Wild Oil Nut.

Mountains in the west, Swartz! Macfadyen! Cuming; interior, St. Ann, Purdie! near Troy, 2500 ft.; Malvern, 2200 ft.; Peckham, Clarendon, 2000 ft.; Harris! Fl. Jam. 8715, 9738, 12,828.

Shrub or tree, 10-20 ft. high, the whole glabrous. Leaves ovate to elliptical, apex acute or subacuminate, base rounded, not lobed, entire, 2 basal nerves ascending not far from the margin, the rest nearly horizontal, papery, 7-14 cm. l.; petiole 3-7.5 cm. l.; stipules gland-like, deciduous. Bracts ovate, 1 mm. 1. Cymes terminal and axillary, repeatedly two-forked, the branches of each fork equal and widely diverging; peduncle 3-10 cm. 1.; flowers on the ultimate branches forming racemes. Male flowers: Calyx 2.5 mm. 1., lobes ovate-rounded, 1 mm. l. Petals elliptical, about twice as long as the calyx. Filaments 8-10, united below; anthers mucronate at apex, 1 mm. l. Female flowers twice as long as the male, solitary in the fork at the base of the racemes. Petals cohering into a tube beyond the middle. Ovary glabrous. Styles very short; stigmas thick. Capsule somewhat globular; cocci 3, or 2, about 2 cm. l. Seeds 1 or 2 in each coccus, 14 mm. l., 9 mm. br., oblongellipsoidal.

5. J. hernandiæfolia Vent. Jard. Malm. i. 52 (1803); Griseb. loc. cit.; Muell. Arg. tom. cit. 1077; Urb. Symb. Ant. iv. 349; Pax l. c.

Bancroft!—Porto Rico, Hispaniola.

Shrub 6-12 ft. high. Leaves ovate, peltate, acuminate, base roundedobtuse or truncate-subcordate or cordate, not lobed or the lower leaves 3-lobed, margin entire, wavy or with an occasional tooth, 7-9 cm. 1.; petiole about as long. Cymes slender, repeatedly two-forked, about as long as the leaves. Bracts triangular, 5 mm. 1. Calyx about 2 mm. 1.; segments about 1 mm. 1., elliptical, apex rounded. Petals white, about 4 mm. l., obovate-oblong, cohering to about the middle. Disk-glands 5, free. Stamens 10, variously united; anthers small, 5 mm. l., apiculate. Ovary glabrous. Capsule 1.5 cm. l.

[ALEURITES Forst.

Trees mostly with stellate hairs. Leaves alternate, longstalked, large, 5-7-nerved at the base, 3-5-lobed or not lobed, with two glands at the top of the stalk. Flowers monecious or subdirections, with petals, in loose cymose panicles, repeatedly forked, at the ends of branches, the female flower solitary in the primary forks. Calyx globose, closed in bud, splitting valvately

into two or three lobes. Petals 5, longer than the calyx. Male flowers: Stamens 15-20 in the Jamaican species, attached to a conical receptacle; the five outer opposite the petals and alternate with small glands. No rudiment of an ovary. Female flowers: Ovary 2-5-celled, generally 2-celled in A. moluccana; styles as many as the cells, divided into two branches; ovules solitary. Fruit large, fleshy outside, indehiscent. Seeds without a caruncle; seed-coat thick, woody; endosperm thick, hard.

Species 4, natives of Eastern Asia and Polynesia, one of which (A. moluccana) is found also naturalized throughout the tropics.

A. moluceana Willd. Sp. Pl. iv. 590 (1805); Muell. Arg. in DC. Prodr. av. p. 2, 723 & in Fl. Bras. vi. pt. 2, 304, t. 45; Watt Dict. Econ. Prod. Ind.; Hook. f. Fl. Brit. Ind. v. 384; Urb. Symb. Hermann in Herb. Mus. Brit.

Candle Nut.

Naturalized; Knowsley Park, 2550 ft., Miss Wood. Native of Malaya

and Polynesia, naturalized in the tropics.

Tree 20-60 ft. Leaves simple or 3-5(-7-)lobed, the simple forms usually ovate, acute; lobes usually triangular, acute, 15-18 cm. l. (1-2.5 dm. l.); young leaves and twigs densely covered with stellate hairs. Panicles 1-1.5 dm. l. and br., tomentellous, with numerous white flowers. Male flowers: Calyx 3 mm. l. Petals 7-9 mm. l. Fruit 5-6 cm. in diam.,

olive-coloured, containing one or two large, hard seeds.

The root yields a brown dye. The seeds contain 50 per cent. of oil, which is "very fluid, of an amber colour, without smell, congealing at 32° F., insoluble in alcohol, readily saponifiable, and very strongly drying" (U.S. Dispens.). The oil is largely exported from Polynesia, and used in the candle trade; it is superior to linseed oil as a drying oil for paint, &c. Medicinally, a dose of half an ounce of the oil acts as a mild purgative; it also possesses a nutty flavour (Pharm. of India). The nuts are edible, tasting like walnuts, but should be eaten with caution. (See Watt Comm. Prod. Ind.)]

19. ACIDOCROTON Griseb.

Shrubs armed with straight diverging stipular spines, or unarmed. Leaves small, pinnately veined, obovate, thick, entire. Flowers few amongst the leaves, rather small, with very short stalks, monœcious, with petals. Male flowers: Calyx 5-6-cleft, spreading. Petals 5-7, larger than the calyx, spreading, contorted-imbricate. Stamens numerous, attached to a hairy disklike receptacle; anther-cells distinct, attached to a rather broad connective. No rudiment of an ovary. Female flowers: Calyx like that of the male. Petals rudimentary. Ovary 3-celled; styles flat, spreading, thick, broadly obovate, retuse; ovules solitary. Capsule splitting into 2-valved cocci. Seeds rather large, with a white caruncle.

Species 2, one a native of Jamaica, the other of Cuba.

A. verrucosus Urb. Symb. Ant. vii. 513 (1913). (Fig. 104.)

Peckham Woods, Clarendon, Harris! Fl. Jam. 11,018.

Tree about 12 ft. high; branches ash-coloured, covered with minute warty excrescences, and bearing in the axils of the primary leaves cushionlike contracted branchlets covered with short spine-like stipules and the

bases of petioles. Leaves (on cushions) 1.5-2.5 cm. l., 5-9 mm. br., obovate-elliptical to elliptical oblong, very obtuse at apex, narrowed below into the petiole, (when dry) papery, midrib on upper surface impressed, beneath prominent, nerves not conspicuous; petiole 3-5 mm. l.; stipules spiny, 1-2 mm. 1. Male flowers only seen in bud, proceeding from the topmost cushion-like branchlets. Pedicels 3 mm. 1. Sepals semioval or semiroundish. Petals 5, free, ovate-roundish. Stamens 20, inserted on a disk-like receptacle between obconical fleshy processes which are hairy on the apex; filaments free; anthers introrse, erect, with an awn at apex as long as, or half as long as, the anther.

20. TETRORCHIDIUM Poepp.

Trees or shrubs. Leaves alternate, with two glands at the top of the stalk. Flowers diocious or monocious, without petals, in axillary racemes; male racemes long, with flowers small, sessile or subsessile, in clusters; racemes, with female flowers or male and female mixed, generally shorter, simple, or reduced to a single stalked female flower. Calyx 3-(4-)parted, segments

tropical S. America.

Tree 15-50 ft. high. Leaves obovate- or oblanceolate-elliptical, apex bluntly apiculate or blunt, leathery-membranous, entire or wavy or slightly toothed, glabrous, with two glands at the junction with the petiole, slightly toothed, glabrous, with two glands at the junction with the petiole, 8-20 cm. 1.; midrib prominent beneath, nerves slightly prominent on both sides, veins few, indistinct on upper surface, slightly prominent beneath; midrib, nerves and petiole tinged with red; petiole '5-2 cm. 1. Male panicle 8-18 cm. 1.; female raceme 2-4 cm. 1. Male flowers green: Sepals broadly triangular-concave, midrib keeled inside, puberulous outside, pubescent inside, especially along the keel, 2 mm. 1., 1.7 mm. br. Anthers puberulous, sessile. Female flowers: Sepals broadly triangular, puberulous, about 1 mm. l. Disk-glands 1·5 mm. l. Ovary 2-celled. Stigmas red (in Poeppig's plate), spreading close to the ovary. Capsule about 8 mm. l.

Purdie states that the gum of this tree is collected and spread on the

branches of trees to catch parrots, &c.

21. CHÆTOCARPUS Thw.

Trees or shrubs. Leaves alternate, entire, leathery, with stipules. Flowers diecious, without petals, pubescent, clustered in the axils, or forming a terminal inflorescence by reduction of the leaves. Disk short, ring-like, or irregularly lobed. Male flowers minute: Calyx irregularly 3-5(-8)lobed, segments imbricate. Stamens indefinite, springing at different levels from a central column. Ovary rudimentary, terminating the central column, entire or 2-3-lobed. Female flowers: Calyx as in the male. Ovary 3-celled; styles 3, distinct, 2-cleft; ovules solitary. Capsule globular, densely covered with tubercles or spines, splitting up into three cocci with 2-cleft valves. Seeds with a large caruncle; coat black, shining; endosperm fleshy; cotyledons flat, broad.

Species 8, natives of the tropics in West Indies, South America, Africa, Ceylon and India.

(of various lengths) and column villose. Anther-cells attached separately to the connective which is produced slightly beyond them, oblong-curved, each with a smaller cell on the concave surface. Central column slender, tapering, nearly as long as the calyx. Female flowers: Calyx 2–2·3 mm. l., irregularly 4-cleft, densely puberulous. Disk, lobes 4, 2-parted, opposite the sepals. Capsule 11–12 mm. l. Seeds remaining for long attached to the 3-winged columnla.

22. OMPHALEA L.

Trees, or twining or climbing shrubs Leaves alternate, with two glands at the apex of the petiole, entire, pinnate-nerved, often 3-5-nerved at the base, with stipules small, soon falling. Flowers monecious, without petals, in small cymes which are altogether male or with the central flower female, disposed along the branches of a terminal panicle. Bracts subtending, the cymes on the axis of the panicle somewhat leaf-like. Disk

obscure or wanting. Sepals 4-5, broad, very imbricate. Male flowers: stamens 2-3; filaments united into a very short column; connective of the anthers thick, broad, united into a peltate capshaped mass 2- or 3-lobed at the margin, the anther-cells situated on the periphery near the margins of the lobes. Rudiment of ovary none. Female flowers: Ovary (2-)3-celled; style thick, column-like, obtuse or very shortly (2-)3-lobed; ovules solitary. Fruit thick, 2-3-carpous, fleshy outside, with a hard indehiscent endocarp, or at length splitting up into 2-valved cocci. Seeds subglobular, without a caruncle.

Species 15, of which one is a native of Madagascar, one of Australia, one of the Philippines, the rest tropical American

Tree 30-45 ft. high. Leaves 1-3 dm. l., broadly or narrowly obovate-

elliptical or oblong, usually narrowed at the base, usually with a nerve on elliptical or oblong, usually narrowed at the base, usually with a nerve on each side of the base parallel with the margin; petiole 3-5 cm. l., glands at apex disk-like. Bracts much longer than the petioles, 6-15 cm. l., linear-spathulate, narrowed petiolar towards the base, the petiolar part longer than the blade, at length dropping off. Anthers 3. Ovary glabrous, ovoid, acuminate. Capsule 3.5 cm. high, about 7.5 cm. in diam., endocarp hard, wooden, thick, exocarp thin. Seeds globular, about 2.5 cm. in diam. Pharmacosycea jamaicensis Liebm. (in Bidensk. Selsk. Skrift. ii. 331 (1851)) is referred by Urban (Symb. Ant. vi. 99) and Pax l.c. to this species. We have not seen the specimen which was collected by Oersted near Kingston. Liebmann's description contains no reference to flower

The timber of this tree is of no service in building, being of a soft brittle nature. The kernels of the nuts in the raw state are delicately sweet and wholesome; they are produced in great abundance, and, when ripe, they burst from the pod and fall to the ground. When roasted, they are equal, if not superior, to chestnuts. By compression they yield a very sweet and fine-flavoured oil. The cotyledons are emetic and purgative.

As this tree is of quick growth, bears fruit in three or four years, and succeeds very well in the poorest soils, it is well worthy of extensive cultivation (Lunan).

2. **0.** diandra L. - Shrub or tree, 9 to 15 ft. high, glabrous. Leaves 3·5-8 cm. l., elliptical, rounded or emarginate at both ends, marginal portion distinctly marked and sometimes revolute, margin entire, with glandular points like undeveloped teeth, leathery, midrib prominent beneath; petioles 3-6 mm. l.; stipules represented by disk-like glands. Bracts with a fleshy cup-shaped gland on each side. Male spikes to 10 cm. l., somewhat thick. Male flowers sessile. Stamens spreading. Female inflorescence 2-3·5 cm. l. Female flowers subsessile; pedicels 1-4 mm. l. Calyx-lobes fleshy, sometimes with glands. Styles recurved at apex. Capsule 7-8 mm. in diam., 7 mm. high, dark brown, smooth. Seeds 4 mm. l., dark grey.
- 2. D. faseiculata Millsp. in Field Columb. Mus. Bot. ii. 375 (1913); Fawc. & Rendle loc. cit.; leaves sessile, 3-9 cm. l., ovate, sometimes elliptical or oblong, obtuse at both ends; female inflorescence terminal, a sessile cluster surrounded by three clustered leaves, with a prong-like gland at each side of the bract. Type in Herb. New York Bot. Gard.

Dolphin Head, 1800 ft., Harris! Fl. Jam. 10,266.

Tree 15 ft. high, glabrous. Leaves 3-9 cm. l., sessile, ovate, sometimes oblong or elliptical, obtuse at both ends, entire, papery-leathery, midrib prominent beneath, venation prominulous, alternate below, opposite and three in a cluster on flowering branches. Female inflorescence a sessile cluster surrounded by three clustered leaves. Female flowers sessile or subsessile. Calyx about 2 mm. l., sepals 3, very broadly ovate, blunt lobes, closely adpressed to the ovary, fleshy especially below. Styles united at the base, spreading, recurved. Male flowers and fruit not seen.

3. D. alpina Fawe. & Rendle loc. cit.; leaves petiolate, $2 \cdot 5 - 3 \cdot 5$ cm. l., ovate, sometimes elliptical, obtuse at both ends; male inflorescence terminal and axillary at nodes from which the leaves have dropped. Type in Herb. Jam.

John Crow Peak, Blue Mts., 6000 ft., Harris! Fl. Jam. 12,906. Tree 18 ft. high, glabrous. Leaves 2.5-3.5 cm. l., ovate to elliptical,

obtuse at both ends, margin with a few small teeth, somewhat revolute when dry, without glands, papery-leathery, nerves and veins net-veined on upper surface, midrib prominent beneath but venation indistinct; petioles about 4 mm. l.; stipules roundish-deltoid, about 1 mm. l. Inflorescence, male with about twenty bracts, terminal and axillary at nodes from which the leaves have dropped, female not seen. Bracts: male, roundish-ovate, minutely toothed. Male flowers: Sepals roundishrhomboid-ovate, margin irregular, minutely toothed. Bracts and sepals deep crimson.

24. SAPIUM Jacq.

Trees or shrubs, glabrous, with milky juice. Leaves alternate, entire or obscurely denticulate, nerves (in Jamaican species) almost at right angles to midrib, with or without 2 glands at

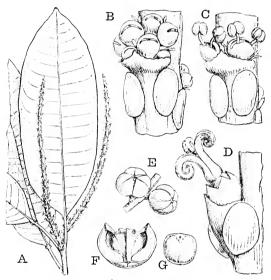

Fig. 109.—Sapium jamaicense Sw.

- A, Leaves and inflorescence $\times \frac{1}{2}$. B, Part of spike with young male flowers X 5.
- C. Ditto with male flowers × 5.

 F. Coccus with columella and seed × 2.
 G. Seed × 2.

the apex of the petiole, with stipules. Flowers monecious, without petals, in terminal or lateral spikes or racemes. Male flowers generally three in axil of each bract along the upper part of the spike, which at length falls off; female, solitary in axil of each bract, several in the lower part of the spike, or one only, or none. Bracts often with glands on each side at the base. Disk wanting. Male flowers: Calyx small, shortly and unequally

2-3-toothed or -lobed. Stamens 2 or 3; filaments free; anthers globose. Rudiment of ovary wanting. Female flowers: Calyx 3-toothed or generally 3-cleft. Ovary 2-3-celled; styles 3(-2), distinct or united below, recurved-spreading, not divided; ovules solitary in each cell. Capsule globular or pear-shaped, more or less fleshy or pulpy, ultimately splitting into three 2-valved cocci; columella 3-winged. Seeds not carunculate.

Species nearly 100, widely dispersed through the tropics.

Leaves oblong-elliptical; petioles with glands 1. S. jamaicense. Leaves elliptical-obovate; petioles without glands.

Ovary sessile or subsessile; styles united only at base 2. S. cuncatum. Ovary stalked; styles united halfway 3. S. Harrisii.

1. S. jamaicense Sw. Adnot. Bot. 62 (1829); leaves oblongelliptical or elliptical; petiole with small sessile oblong glands; spikes in axils of topmost leaves at apex of branch; ovary sessile. —Urb, Sumb, Aut, iii, 308; Huber in Bull. Herb, Boiss, sér. 2, vi. 347, f. 2; Hemsley in Hook. Ic. Pl. t. 2889; Pax in Engl. Pflanzenreich iv. 147. v. 205. S. laurifolium Griseb. Fl. Br. W. Ind. 49 (1859). S. laurocerasus var. ellipticum and var. laurifolium Muell, Arg. in Linnæa xxxii. 116 (1863). S. arboreum foliis &c. Browne Hist. Jam. 338. Hippomane 2-glandulosa Sw. Obs. Bot. 370 (1791) (non L.). Cuba, Hispaniola, Central America, Colombia.

Tree 30-60 ft. high. Leaves 7-22 cm. l., oblong-elliptical or elliptical,
apex rounded, abruptly and shortly acuminate, base obtuse to wedgeshaned margin entire or wavy or obscurely denticulate, papery; nerves

shaped, margin entire or wavy or obscurely denticulate, papery; nerves numerous (to thirty on each side), about 2 mm. apart, bending upwards near margin, prominent; petiole 2-4 cm. l., glands small, sessile, oblong. Spikes 2-4, in axils of topmost leaves at apex of branches, to 15 cm. l. Bracts somewhat roundish with two elliptical glands; bracteoles fringed. Male flowers 3-7 in axil of each bract: Calyx 2- (3-)lobed. Stamens two. Female flowers: Calyx 3-toothed. Ovary 3- (2-)celled. Styles at length circinate. Capsule globular, 7-8 mm. in diam. Seeds about 4 mm. l., roundish-lens-shaped, roughly net-veined.

The tree yields a thick sticky resin, formerly used for boiling-house lamps, also used for bird-lime. The wood is soft and coarse. (Browne)

2. S. cuneatum Griseb. Fl. Br. W. Ind. 49 (1859); leaves elliptical-obovate; petiole without glands; spikes in axils of leaves; ovary sessile or shortly stalked; styles two or three, very shortly united at base.—Pax in Engl. Pflanzenreich iv. 147.

v. 235. Exceedia cuneata Muell. Arg. in DC. Prodr. xv. pt. 2, 1208 (1866).

Macfadyen; Purdie; Moneague, Prior! March; Potsdam, 2600 ft.; Croft's Mt., Clarendon, 2500 ft.; Harris! Fl. Jam. 9817, 11,214.

Tree to 40 ft. high, glabrous. Twigs with scars of fallen leaves. Leaves 8-15 cm. l., elliptical-obovate, apex rounded or apiculate, base wedgeshaped, margin entire, sometimes bearing glands and usually two above the base of the limb, papery; nerves not more than about twenty on each side, 4-8 mm. apart, slightly prominent; petiole 1-2 cm. l., without glands; stipules roundish-ovate. Spikes numerous, in the axils of leaves, 5-7 cm. l. Bracts ovate or triangular, with small teeth, longer than the glands and covering the female calyx. Male flowers: Calyx 2-lobed, red. Stamens two; anthers red. Female flowers: Calyx 3-lobed. Ovary glabrous. Styles 2-3, only very shortly united at base. Capsule somewhat more than 1 cm. in diam. Seeds ellipsoidal, about 8 mm. l., red.

3. S. Harrisii Urban ex Pax in Engl. Pflanzenreich iv. 147. v. 236 (1912); leaves narrowly elliptical-obovate; petiole without glands; spikes in axil of leaves; ovary stalked; styles two, united halfway.

Hardware Gap, Blue Mts., 4000 ft., Harris! Fl. Jam. 10,117.

Tree to 60 ft. high, glabrous. Twigs with scars of fallen leaves. Leaves 10-17 cm. l., elliptical-obovate, apex rounded or shortly apiculate, base wedge-shaped, margin entire, revolute, sometimes bearing glands, leathery; nerves not more than about twenty on each side, 6-10 mm. apart, inconspicuous; petiole 2-3 cm. l., without glands; stipules like those of S. cuneatum. Spikes, female only seen, axillary, 6-8 cm. l. Bracts very broad, truncate, with a somewhat cup-shaped gland at each side. Flowers diccious. Female flowers: Sepals two, broadly triangular, 1.2-1.5 mm.l. Ovary stalked, stalk about 3 mm. l., glabrous, 2-celled. Styles two, united halfway; free part recurved. Capsule (fide Pax) unripe, ovoid, acute.

25. GRIMMEODENDRON Urb.

Trees or shrubs, glabrous. Leaves alternate, obscurely toothed or serrulate. Spikes terminal, slender, 2-sexual. Bracts without glands. Flowers monecious, without petals. Male flowers subsessile, two or a few in the axil of each bract; female one or two at the base of the spike, sessile, solitary in the axil of each bract. Disk wanting. Male flowers: Calyx with three valvate lobes. Stamens three; filaments united into a column almost its whole length. Rudiment of ovary wanting. Female flowers: Calyx 3-cleft. Ovary 3-celled. Styles united below, free above, recurved, undivided. Ovules solitary in each cell. Capsule globular, splitting up into 2-valved cocci, the central columella persistent, 3-winged above. Seeds ovate-globular without a caruncle, marked near the hilum as if part of the skin had been scraped off.

Species 2, one a native of Jamaica, the other of the Bahamas and Cuba.

G. jamaicense Urb. Symb. Aut. r. 399 (1908), fig. N. o; Pax in Eugl. Pflanzeureich iv. 147. v. 258, fig. 50, N, o.

Near Troy, 2000-2200 ft.; Mulgrave, St. Elizabeth, 1300 ft.; Harris!

Fl. Jam, 9413, 9437, 12,380.

Tree 40-50 ft. high. Leaves 7-17 cm. l., obovate-, or oblanceolate-elliptical, apex truncate, emarginate, rounded, or sometimes very shortly acuminate, base wedge-shaped, margin more or less minutely toothed, nerves and veins slightly prominent and net-veined on both sides, somewhat leathery; petioles 1-2 cm. l. Spikes 12-17 cm. l., peduncle 1-2 5 cm. l. Bracts truncate, semilunar, without glands. Male flowers several in axil of each bract. Calyx ·7 mm. l. Female flowers: Calyx about 1·5 mm. l. Styles united one-third to one-half the length. Cansule 10-12 mm. 1. ovate-globular.

We have seen male flowers in bud only, in which there is no union of the filaments; the seeds also are immature and do not show the "area derasa." The examination of adequate material might prove this species

to belong to Sapium.

26. HIPPOMANE L.

A glabrous tree with copious milky juice which is very poisonous and acrid. Leaves alternate, long-stalked, with a large orbicular dark red gland at top of petiole. Flowers monocious, without petals, in terminal spikes. Bracts distant from one another, with a peltate gland on each side at the base. Male flowers, three to many, in the axil of each bract, female solitary (or rarely with male flowers) in the axil of the lowest one or two bracts or wanting, rarely associated with male flowers in the same bract. Disk wanting. Male flowers: Calyx small, with 2-3 imbricate short lobes. Stamens two (occasionally three); filaments united into a column, at length shortly exserted, very shortly free at the apex. Rudiment of ovary wanting. Female flowers: Calyx small with three segments. Ovary with 6-9 cells; styles united at the base, above free, linear, undivided, spreading star-like; ovules solitary in each cell. Drupe rather large, not splitting open, with thick flesh, endocarp very thick, bony, with several cells. Seeds not carunculate.

Species 1, native of Florida and Keys, Bahamas, Cayman, West Indies, Curação, Mexico to Venezuela.

Between Two Mile Wood and the Town savanna, Stoane Herb. v. 55!

Houstoun! Port Morant, Purdie! coast between Portland Point and Rocky Point; Castleton; Harris! Fl. Jam. 10,189.—Distribution of genus.

Tree 12-60 ft. high, trunk 6 inches to 3 ft. in diameter, with bark inch thick. Leaves 2.5-10 cm. 1, elliptical or elliptical-ovate, apex

acute or cuspidate, base rounded, truncate, or slightly cordate; usually nerves and veins prominent and conspicuously net-veined above, less so beneath. Rhachis of spikes 4-15 cm. l., dark purple. Male flowers: Calyx about 1 mm. l. Female flowers: Calyx 2.5-3 mm. l. Styles darkred. Fruit about 3 cm. in diam., somewhat globular, yellow with reddish cheek when ripe. Seeds about 4 mm. l.

Sloane states that large boards are sawn from the trunk of this tree, not only for wainscot and cabinets, but even for the largest tables, this wood being much coveted by all people for its polish, durability, and delicate and various colours. Browne adds, "to guard against its corrosive

juices, the woodcutters are obliged to make a fire round the body of every tree some time before they can venture to fell them"; they burn the bark off, and so get rid of the acrid sap. Also see Barham, Hortus Americanus, 99.

27. GYMNANTHES Sw.

Trees or shrubs, glabrous. Leaves alternate entire or crenate-Flowers monecious, without sepals or petals, racemose. Racemes or spikes axillary, sometimes also terminal, solitary or clustered, often 2-sexual. Bracts ovate, enclosing the flowers in bud, sessile on a short peduncle, sometimes glandular outside at the back or at the sides. Male flowers solitary, or 2-7 together, in the axil of a bract; female flowers solitary in the axil of a bract, one or two at the base of the raceme, or several in a distinct raceme. Disk wanting. Male flowers: each usually subtended by one or two bracteoles (sepals of some authors), soon falling. Stamens 2-4; filaments free or united. Rudiment of ovary wanting. Female flowers: bracteoles (sepals of some authors), 2-4. Ovary sessile or stalked, 3-celled; styles distinct, or united half-way or only at the base, recurved, undivided; ovules solitary in each cell. Capsule splitting up from the persistent axis into three 2-valved cocci. Seeds generally carunculate.

Species 12, natives of the West Indies, of which one is also found in Brazil, and one in Florida, while three species are found only in Mexico.

Leaves oblanceolate, obovate, obovate-elliptical. Malc bracts 3-flowered.

Apex of leaves obtuse. Ovary stalked above the

bracteoles, long pedunculate 1. G. lucidu.

Apex of leaves abruptly and shortly acuminate.

Leaves roundish elliptical to lanceolate-elliptical. Male bracts 1-flowered.

Ovary sessile, with peduncle not longer than ovary ... 3. G. elliptica.

1. G. lucida Sw. Prodr. 96 (1788); leaves 3-9 cm. l., oblanceolate, or oblong-obovate, or even obovate-elliptical, apex obtnse, leathery, shining on upper surface, nerves and veins prominently net-veined on the upper surface; bracts broadly ovate, without glands, male 3-flowered; filaments free; ovary stalked above the bracteoles, with a long peduncle increasing in fruit.—Sarg. Silv. vii. 30, t. 309; Pax in Engl. Phanzenreich iv. 147. r. 82; Small Fl. S.E. U.S. 703; Urb. Symb. Ant. iv. 352 (1905). Ateramnus foliis oblongis, &c. Browne Hist. Jam. 339 (1). Exceedaria lucida Sw. Fl. Ind. Occ. 1122 (1800); Jussien Enphorb. Tent. t. 16,

f. 55; Nutt. Sylv. ii. 60, t. 61; Griseb. Fl. Br. W. Ind. 50. Sebastiania lucida Muell. Arg. in DC. Prodr. xv. pt. 2, 1181 (1866). (Fig. 111.)

bracts and the male flowers in their axils, enlarged.

D, Capsule, nat. size. E, Seed × 2.

slightly crenate-serrulate, with or without one or two glands near the base beneath, leathery, shining on upper surface; nerves and veins prominently net-veined on the upper surface; petiole 5–10 mm. l. Flowers monœcious. Spikes 1–3 cm. l., 2-sexual or male, terminal and axillary, dense-flowered. Bracts broadly ovate, male 3-flowered, about 1 mm. l. Male flowers: each subtended by a bracteole (sepal of some authors), soon falling. Stamens in the middle flower 3–4, in the lateral 2–3; filaments free. Female flowers: Bracteoles (sepals of some authors) scale-like, minute, scarcely 1 mm. l., not all springing from the same level. Ovary stalked above the bracteoles; stalk short in the flower but continuing to grow to 1·5 or 2 cm. l. in fruit; pedicel in flower about 7 mm. l., growing to 2·5 or 3 cm. l. in fruit. Styles united for about half their length. Capsule

7 mm. l., about 1 cm. in diam., 3-lobed-globular, more or less net-veined on surface. Seeds 4-5 mm. in diam., globular, dark brownish; caruncle

flat, circular, white, about 2 mm. in diam.

The wood is heavy, hard, close-grained, and susceptible of receiving a beautiful polish. It is rich dark brown streaked with yellow, with thick bright yellow sapwood. A cubic foot of absolutely dry wood weighs nearly 68 lbs. In Florida it is occasionally manufactured into canes. (Sargent)

2. G. glandulosa Muell. Arg. in Linnea xxxii. 106 (1863); leaves 3-7 cm. l., ovate to oblong-lanceolate, acuminate, membranous, net-veined more or less prominently especially beneath; inflorescence male and female terminal, springing from wood of the same year, monœcious; bracts: male transversely oblong, sessile on a short peduncle, with a swelling extending up from the peduncle on the back, with one or two groups of minute glands near the apex of the peduncle, with 5-(3-7) flowers; filaments as long as or somewhat shorter than the anther, united almost or quite to the apex; female flowers sessile above the bract; ovary sessile above the bracteoles.—G. jamaicensis Urb. Symb. Ant. vii. 516 (1913). Excœcaria glandulosa Sw. Fl. Ind. Occ. 1124 (1800). Actinostemon jamaicensis Britton in Torr. Bot. Club xxxix. 7 (1912). Ricini fructu glabro, arbor &c. Sloane Cat. 131 & Hist. ii. 7, t. 158, f. 2.

Gully between Town savanna and Two Mile Wood, Sloane Herb. v. 57! Wright! Swartz! Grants Pen, near Albion Estate, Yallahs Bay, Harris &

Britton! Harris! Fl. Jam. 10,643, 10,818, 10,826, 10,936.

Tree 20-30 ft. high. Leaves crenate-serrulate, rarely with one or two glands at apex of petiole beneath; petioles slender 5-1 cm. l. Stipules 2-4 mm. l., linear-acuminate, soon falling. Inflorescence terminal, male only, with about twenty bracts, or male with one sessile female flower at base, or one or two female flowers on a separate spike. Male flowers, each with or without one or two lanceolate acuminate bracteoles (sepals of some authors). Stamens 2, rarely 3. Female flowers: Bracteoles (sepals of some authors) 3. Styles united below, free above. Capsule (only valves seen) apparently slightly larger than that of G. integra. Seeds somewhat like those of G. integra, but globular, darker in colour, and somewhat smaller, 3·3 mm. br.; caruncle wanting.

3. G. elliptica Sw. Prodr. 96 (1788); leaves 2·5-10 cm. l., roundish-elliptical to lanceolate-elliptical, somewhat leathery, shining on upper surface, nerves and veins more or less prominulous on the upper surface; bracts small, transversely elliptical, with a large fleshy gland on each side, male 1-flowered; filaments very short, free; ovary sessile above the bracteoles: peduncle as long as, or shorter than the ovary, not increasing in fruit.—Pax tom. cit. 86. Excecaria tinifolia Sw. Fl. Ind. Occ. 1119 (1800); Griseb. op. cit. 51. Sebastiania elliptica Muell. Arg. in DC. Prodr. loc. cit. (1866). Specimens from Swartz in Herb. Mus. Brit. & Herb. Stockholm.

Shrub or tree 6-30 ft. high (sometimes a large forest tree). Leaves 2.5-10 cm. l., roundish-elliptical to lanceolate-elliptical, entire or occasionally very bluntly glandular-serrulate, without glands at the base, somewhat leathery, shining on upper surface; nerves and veins more or less prominulous on the upper surface; petiole 1-10 mm. 1. Flowers described as diecious, but certainly sometimes monecious, male green, anthers yellow. Male spikes 3-9 cm. l., solitary or 2-3 together in axils of leaves, sessile or shortly stalked. Bracts small, transversely elliptical, with a large fleshy gland on each side, 1-flowered, united to the short peduncle. Bracteoles (sepals of some authors) 2, unequal. Stamens 2 or 3; filaments short. Female racemes 1-2 cm. 1., lax-flowered, axillary, 5-7-flowered. Bracts broad, with a gland on each side, 1-flowered. Pedicel 2-4 mm. l., not increasing in length in fruit. Bracteoles (sepals of some authors) 3-4. Ovary sessile above the bracteoles. Styles shortly united below, free parts recurved. Capsule 5-6 mm. 1., 7-8 mm. in diam., 3-lobed-globular. Seeds about 5 mm. 1., about 3 mm. br., ellipsoidal, greyish-black; caruncle flat, white, about 1 mm. in diam.

4. G. integra nom. nov.; leaves 4.5-9 cm. l., obovate-elliptical to elliptical, abruptly and shortly acuminate, leathery, nerves slightly prominent especially beneath, veins somewhat indistinct especially beneath; bracts: male roundish, broader than long, not glandular, or sometimes slightly swollen at base with a minute lateral gland, 3-flowered, uppermost with 1 flower, female roundish-ovate with two groups of several minute pinkish stipular glands; filaments united at base; ovary sessile on the bracteole, shortly stalked above, the bract, not increasing in fruit.—Gymnanthes glandulosa Pax in Engl. Pflanzenreich iv. 147. v. 83 (1912) non Muell. Arg. Excœcaria glandulosa Griseb. Fl. Br. W. Ind. 51 (1859) (non Sw.). Sebastiania glandulosa Muell. Arg. in DC, Prodr. xv. pt. 2, 1186 (1866).

Fl. Jam. 10,159, 11,225.

Tree 15-30 ft. high. Leaves 4:5-9 cm. l., obovate-elliptical to elliptical, abruptly and shortly acuminate, base rounded or subcordate to wedgeshaped and unequal-sided, margin entire, revolute, without glands, leathery, nerves slightly prominent especially beneath, veins somewhat indistinct especially beneath; petioles 3-8 mm. l., thick. Inflorescence apparently diecious, male with several bracts, to 15, axillary, female with 1 or 2 flowers, terminal. Bracts: male roundish, broader than long, not glandular or rarely slightly swollen at base with a minute lateral gland at base, 3-flowered, uppermost bracts with 1 flower; female roundish-ovate, with 2 groups of several minute pinkish glands in the place of stipules. Male flowers each with or without 1 dentate bracteole (sepal of some authors). Stamens 3(-4). Filaments much shorter than the anthers, united at the base. Female flowers shortly stalked above the bract. Bracteole broader than long, minutely toothed. Ovary sessile above the bracteole. Styles long, recurved, united at the base only. Capsule about 7 mm. l. Seeds ellipsoidal globular, 4 mm. l., 3.5 mm. br., buff-coloured with irregular brown or black blotches; caruncle vellow, like a minute pin's head.

28. HURA L.

Trees. Leaves alternate, broad. Flowers monœcious, without Male spikes terminal with crowded flowers, solitary to each bract. Bracts enclosing the bud, splitting irregularly during flowering. Female flowers solitary in the uppermost

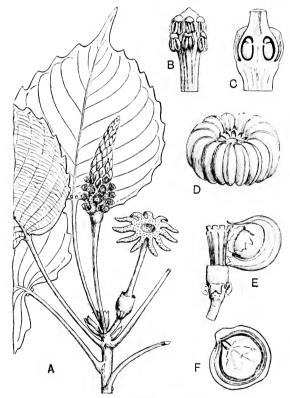

Fig. 112.-Hura crepitans L.

axils or under the male spike. Disk none. Male flowers: Calvx wanting or forming a more or less complete rim or cup, margin irregular or toothed. Stamens 8-20; filaments united with the connectives into a column; anther-cells distinct, attached in 2-4 or 8-10 whorls on the outside of the column below the top. Rudiment of ovary none. Female flowers: Calyx broadly cup-shaped, truncate, entire. Ovary 5-20-celled; styles united into a long fleshy column, funnel-like above and spreading star-like at the top; ovules solitary in each cell. Capsule large, depressed in the centre, splitting up with a loud report and scattering the numerous 2-valved cocci. Seeds laterally compressed, lens-shaped, without caruncle; endosperm fleshy; cotyledons broad, flat.

Species 2, natives of tropical America.

Sandbox Tree.

Sandbox Tree. Browne! Macfadyen! Purdie! Mt. Diablo Prior! Harris! Fl. Jam. 8383.—West Indies, tropical continental America; cultivated and sometimes naturalized in the tropics of the Old World.

Tree 30-80(-100) ft. high; branches spiny or unarmed. Leaves 5·3 dm. l., roundish-ovate, abruptly and shortly acuminate, base cordate or rounded, entire, or obscurely or conspicuously wavy-toothed, more or less pubescent on the nerves beneath, densely so at base of midrib, paperymembranous; petiole as long as, or longer than the limb or sometimes shorter; stipules lanceolate, 1-1·5 cm.l., soon falling. Spike, male bright red, 3-5 cm.l.; peduncle 5-11 cm.l. Anther-cells usually in 2 whorls. Female flower dull red, subsessile, or peduncle to 2 cm.l. Ovary with style at length 3-4(-5) cm.l. Capsule to 8 cm. in diam., 4 cm. high, depressed-globular concave above and below, furrowed between the cocci. depressed-globular concave above and below, furrowed between the cocci. Seeds about 2 cm. in diam.

29. EUPHORBIA L.

Herbs, undershrubs or shrubs, with acrid milky juice. Leaves, the lower or all alternate, or the upper or all opposite, simple, margin entire or toothed. Several male flowers and one female flower enclosed within an involucre, a "cyathium." Involucre calyx-like, campanulate to cylindrical, regular or a little unequal, lobes 4-5; glands as many or fewer, outside the lobes and alternate with them. Male flowers within the involucre indefinite in number, stalked. Perianth none or sometimes represented by a minute scale at the joint. Stamen one, the short filament jointed with the pedicel. Bracteoles within the involucre linear or setaceous, sometimes partly united. Female flower one in the centre of the involucre, pedicel at length lengthened beyond the involucre. Perianth none or of three minute scales. Ovary sessile at the top of the pedicel, 3-celled; styles three, distinct or more or less united, spreading above, entire or divided into two; ovules solitary. Capsule breaking up from the persistent axis into three 2-valved cocci; endocarp horny. Seeds without a caruncle in Jamaican species (present in the naturalized *E. Peplus*), with endosperm; cotyledons flat, broad.

Species about 1000, very widely dispersed in the temperate

regions, fewer within the tropics.

. Glands of the involucre with a petaloid appendage.*		
Leaves all opposite, shortly petioled, usually oblique		
at the base. Herbs or shrubs.		
Shrubby, or perennial herbs.

Jam. 6751, 9524, 9967, 11,627.—Bermuda, Florida and Keys, Bahamas, West Indies, Central America, Venezuela, Brazil.

A low shrubby glabrous plant, 1-3 ft. high or more. Stems erect to prostrate, erect branches sometimes leafless below, jointed, somewhat swollen at the nodes. Leaves somewhat fleshy, elliptical to ovate, often somewhat folded, pointed to blunt, entire, base slightly unequal, auriculatecordate. Stipules triangular-ovate, more or less fringed. Involucres few at the ends of branches, solitary, terminal and axillary, about 1.3 mm. l.,

^{*} Appendage rudimentary in E. hirta, sometimes wanting in E. prostrata and E. thymifolia.

campanulate, glabrous outside, hairy at the throat; lobes triangular, fringed; glands concave, appendages whitish-yellow, transversely elliptical, margin somewhat undulating. Capsule 3-cornered-globular, slightly keeled, glabrous, 2 mm. in diam. Seeds ash colour with a tinge of pink, $1\cdot 4(-1\cdot 2)$ mm. l., $1-\cdot 8$ mm. br., angles and markings inconspicuous.

2. E. myrtillifolia L. Syst. cd. 10, 1048 (1759); erect shrubby perennial plants; leaves obovate-elliptical or roundish, 0.5-1.5 cm. 1.; involucres solitary in the upper axils, hairy outside and inside; capsule minutely puberulous.—Boiss. ia DC. Prodr. xv. pt. 2, 38. E. myrtifolia L. Amæn. v. 379 (1760) & Sp. Pl. ed. 2, 653; Sw. Obs. Bot. 197; Griseb. Fl. Br. W. Ind. 53. E. erecta foliolis &c. Browne Hist. Jan. 235. Browne's specimen, the type, is in Herb. Linn.; name in Solander's hand.

Browne! highest mountains, Liguanea, Broughton! Masson! Blue Mts., Prior! Guava Ridge, 2000 ft., Eggers! above Gordon Town, Harris! Fl. Jam. 5196.

Stem 1-2 ft. high; branches long, slender, more or less erect or spreading, reddish, puberulous, becoming glabrate. Leaves shortly stalked, apex retuse, base roundish, puberulous and paler beneath. Stipules very short, truncate, fringed. Involucres 1·3 mm. 1., campanulate; lobes small, triangular, ciliate; glands with a large roundish yellow appendage. Capsule 2 mm. in diam., 3-angled-globular, slightly keeled. Seeds oblong, acutely 4-angled, wrinkles reticulate.

3. E. hirta L. Sp. Pl. 454 (1753); stems erect or decumbent at base, or sometimes prostrate, young parts hispid with yellow spreading hairs and pubescent with short curved hairs; leaves '5–5 cm. l., more or less hispid to pubescent; involucres cymose, sparingly puberulous; appendage not evident; capsule minutely puberulous with adpressed hairs; seeds pinkish.—Jacq. Collect. v. t. 11, f. 1; Brown in Fl. Trop. Afr. vi. sect. 1, 496 (incl. var.). E. pilulifera Jacq. Collect. ii. 361 (1788) & Ic. Pl. Rar. t. 478; Griseb. Fl. Br. W. Iad. 54; Boiss. in DC. Macfadyen! St. Andrew, McNab! Kingston, Prior! Robertsfield; David's Hill; Cinchona; road to Constitution Hill; Mount Pleasant, Stony Hill, 1200 ft.; Constant Spring to Bardowie, 800 ft.; Harris! Fl. Jam. 5515, 8595, 9029, 11,136, 12,113.—Florida, Central America, Peru.

Annual, \(\frac{1}{2}\)-3 ft. high. Stems erect, branching, with somewhat long internodes. Leaves oblong-elliptical to oblong-lanceolate, obtuse, base rounded or subcordate, denticulate, uppermost smaller and narrower. Stipules to 1 mm. l., triangular. Cymes terminal, densely corymbose, with a pair of leaf-like bracts at base. Bracts 1-1·2 mm. l., linear, acute. Involucres 1·5 mm. l., obconical-campanulate, hairy on outside; lobes entire, narrowly triangular; appendage of the glands white, somewhat semicircular, with entire sinuate or slightly lobed margin broader than the glands. Capsule ovate-roundish, 2 mm. in diam. Seeds elongatedovate, obtusely 4-angled, with distinct prominent wrinkles, 1.1 mm. l.

5. E. brasiliensis Lam. Encyc. ii. 423 (1786); stem erect, much branched, flowering branches very slender; leaves oblong to linear-oblong, blunt, more or less serrulate, especially above, ·8-3 cm. l., those of the flowering branches narrow; cymes terminal, lax, heads few, intermixed with linear bracts; appendages large, white; capsule 2-2.2 mm. in diam.; seeds black with lighter angles and 2-3 transverse ridges.—Boiss. in DC. Prodr. xv. pt. 2, 24 (in part); Muell. Arg. in Fl. Bras. xi. pt. 2, 676 (in part); Millsp. in Field Columb. Mus. Bot. ii. 65, 159. Chamæsyce brasiliensis Small Fl. S.E. U.S. 712 (1903); Millsp. tom. cit. 302.

to Bardowie, 800 ft.; Harris! Fl. Jam. 5457, 6840, 9035, 12,112; near Kingston, 500 ft. Clute! near Port Antonio, Millspaugh.—Bahamas, West

Indies, tropical continental America.

Annual, glabrous, 8-14 inches high. Leaves subsessile. Stipules short, ciliate, triangular, somewhat truncate, broad in outline. Involucres about 1.5 mm. 1., campanulate, glabrous on the outside; lobes triangular-lanceolate, ciliate; appendages obovate-roundish or transversely elliptical. Cocci slightly keeled. Seed ovoid-4-angled.

6. E. nirurioides comb. nov.; stems erect or ascending, red, woody; leaves obovate to oblong, obtuse, serrulate, especially at the upper third; stipules deltoid, thick, margin glandular-dotted, '8-'9 mm. l.; cymes terminal, dense; appendages white or pink, roundish; seeds blackish with yellowish angles, with a few indistinct and incomplete ridges.—Chamesyce nirurioides Millsp. in Field Columb. Mus. Bot. ii. 394 (1914). Type in Field Mus. Herb.

Malvern, Britton, 1186!

Annual; plants low, glabrous; branches 5-10 cm. l. Leaves 3-nerved. Petiole very short. Involucres long-stalked, campanulate, glabrous; lobes elongate-triangular, ciliate at apex; glands waxen, roundish, cupped; appendages thrice the diameter of the glands, entire or mostly so. Capsule glabrous; cocci rounded. Seeds triangular-ovoid, 1 mm. l., '8 mm. br.

Near E. brasiliensis, from which it is readily distinguished by its yellowish seed-angles, glandular-dotted stipules, and a striking resemblance

in habit to Phyllanthus Niruri.

The description is taken from Millspaugh. We have seen only a small portion of Dr. Britton's original specimen presented by him to Herb. Mus. Brit.

7. E. hyssopifolia L. Syst. ed. 10, 1048 (1759) & Sp. Pl. ed. 2, 651; stem erect, simple or branched, somewhat flexuose, branches spreading and somewhat dichotomous, flowering branches very slender; leaves narrowly oblong, blunt, almost ligulate, mostly entire, sometimes sparingly toothed, 1-3 cm. l.; smaller (becoming bracts) on flowering branches; cymes mostly terminal, lax; appendages large, white (or pink); capsule 2-2·5 mm. in diam.; seeds olive-green, with few very inconspicuous transverse ridges.—Urb. Symb. Ant. iv. 355. E. dichotoma &c. Browne Hist. Jam. 235. E. hypericifolia L. var. hyssopifolia Griseb. Fl. Br. W. Ind. 54 (1859). E. brasiliensis Lam. var. hyssopifolia Boiss. in DC. Prodr. xv. pt. 2, 24 (1862); Fawc. Fl. Pl. Jam. 34. Chamæsyce hyssopifolia Small Bull. N.Y. Bot. Gard. iii. 429 (1905) & Fl. S.E. U.S. ed. 2, 1349; Millsp. in Field Columb. Mus. Bot. ii. 397. Browne's specimen, the type, is in Herb. Linn.

Lane in Herb. Sloane clxii. 130! Browne! Kingston, Prior! Green Valley, 1800 ft.; Grove, St. Andrew; road to Constitution Hill, 1500 ft.; Harris! Fl. Jam. 5457, 6840, 9035.—Cuba, Is. of Pines, Hispaniola, Porto Rico, Guadeloupe, Martinique, Grenada, Curação, Florida, tropical continental America.

Annual or perennial, 1.5-3.5 dm., and more, high. Branches glabrous or hairy at apex. Petiole very short. Stipules 5 mm. l., triangular, somewhat cut. Involucres obconical-campanulate, about 1 mm. l., glabrous; lobes triangular; appendages roundish, entire ("seldom entire") Millsp.). Capsule 3-cornered-ovate-globular, glabrous. Seeds ovoid. 4-angled, 1.3 mm. l.

8. E. hypericifolia L. Sp. Pl. 454 (1753); stem erect, simple or branched; leaves irregularly elliptical to oblong, blunt to rounded, serrulate (sometimes sparingly so), 1-3.5 cm. l.; cymes axillary in racemose clusters with few or many involucres, generally with two leaf-like bracts at apex of peduncle; capsule usually small, about 1.5 mm. in diam.; seeds reddish-brown to

Type in Herb. Mus. Brit. Browne's specimen in Herb. Linn. is named E. Chamæsyce by Linnæus.

Lane in Herb. Sloane clxii. 130! Browne! Wright! Broughton! Distin! Kingston, Prior! March! Arnott! J.P. 1007, Morris! Jackson Town, Miss A. Moulton-Barrett! New Market, 1150 ft.; Hope grounds, 700 ft., Harris! Fl. Jam. 9882, 11,803.—Native of tropical America, whence it has been introduced into other tropical and subtropical regions. Annual. Stems . 5-2 dm. l., with numerous slender branches. Leaves

3-7 mm. l., elliptical or oblong-elliptical, or slightly obovate-elliptical, apex rounded or obtuse, base more or less oblique, subsessile, minutely toothed, in the upper part glabrous, or sparingly puberulous, especially beneath and at apex. Stipules triangular, on the upper side usually free, on the lower side united. Involucres about '6 mm. 1. (peduncles '6-2 mm. 1.), campanulate; lobes ovate, ciliate-fringed; glands minute; appendage slightly broader than the gland or wanting. Capsules 3-cornered-globular, 1-1.4 mm. in diam. Seeds ovoid-ellipsoidal, about 1 mm. l.

' 10. E. thymifolia L. Sp. Pl. 454 (1753); prostrate; branches puberulous to glabrate; involucres axillary, glabrous or puberulous, crowded through the shortness of the internodes into very short leafy racemes; younger capsules erect, about 1.4 mm. in diam., puberulous; seeds reddish, acutely 4-angled, with about four transverse ridges.—Burm. f. Fl. Ind. 112; Boiss. in DC. Prodr. xv. pt. 2, 47; Muell. Arg. in Fl. Bras. xi. pt. 2, 684; Watt Dict. Econ. Prod. Ind.; Urb. Symb. Ant. iv. 356. E. maculata L. var. thymifolia Griseb, Fl. Br. W. Ind. 53. Chamæsyce Sloane Cat. 83 & Hist. i. 198. Chamesyce thymifolia Millsp. in Field Columb. Mus. Bot. ii. 412 (1916). Tithymalus humilis ramosissimus &c. Burm. Zeyl. 225, t. 105, f. 3.

St. Jago de la Vega, Sloane Herb. iii. 119! Masson! Macfadyen!-All

hot countries except Australia.

Stems slender, with many branches, 1/2 to 1 ft. and more. Leaves 4-9 mm. l., oblong or oblong-elliptical, obtuse, serrulate-crenate, glabrous a-9 mm. 1., obloing or obloing-emptical, obluse, serrulate-cremate, glabrous or puberulous beneath. Stipules about 1 mm. 1., lanceolate, fringed. Involucres campanulate-obconical, deeply cut on one side, hairy, with long hairs inside; lobes triangular, acute, ciliate; glands small, stalked, appendage as broad or narrower or wanting, those of the glands next the lateral slit sometimes somewhat oblong or ligulate, larger than the gland. Capsule very shortly stalked, obtusely keeled. Seed oblong, 1 mm. 1.

Used like E. hypericifolia.

11. E. Blodgettii Engelm. ex Hitchc. in Rep. Miss. Bot. Gard. iv. 126, t. 13 (1893); glabrous or nearly so; prostrate, spreading, or rarely erect; involucres axillary, usually solitary or two together; capsule 1.5-2 mm. in diam,; seeds reddish to grey, inconspicuously tranversely ridged.—*Urb. Symb. Ant. vi.* 90. Chamesyce Blodgettii *Small Fl. S.E. U. States*, 712 (1903); Millsp. tom. cit. 303.

Palisadoes, also in pastures, Broughton! Fort Clarence Hill; Pedro Bluff; Harris! Fl. Jam. 9536, 9731; Lucea, Hitchcock.—Bermuda, Key West and S. Florida, Bahamas, Cayman Is., Cuba.

Annual or biennial. Stem 3-17 inches, branched, woody below. Leaves 3-13 mm. 1., irregularly elliptical, or slightly obovate elliptical, apex rounded, more or less serrulate towards the apex. Stipules triangular, margin cut. Involucres about 7 mm. 1., campanulate, glabrous outside, hairy within; lobes triangular, toothed; appendages white or pinkish, as broad as, or slightly broader than, the gland. Capsule 3-corneredglobular, slightly keeled, glabrous. Seeds about 1 mm. 1., 4-angled. The leaves are mostly small and entire on exposed sea-shores, larger and toothed amongst grass or in shade.

12. E. Oerstediana Boiss. in DC. Prodr. xv. pt. 2, 59 (1862); herbs; stems hollow-jointed, constricted at joints; leaves alternate but opposite or ternate at ends of branches; stipules rudimentary; cymes terminal, corymbose; glands 2, with two lips—the outer with only a narrow edge free; the appendage equalling the inner lip; seeds mammillose-tuberculate in longitudinal lines.—Urb. Symb. Ant. v. 393 & vi. 90. Poinsettia Oerstediana Klotzsch d' Garcke in Monatsb. Akad. Berl. 1859, 253 (name only) & in Abh. Akad. Berl. 1859, 103 (1860).
 E. geniculata Eggers Flor. St. Croix & Virg. Isl. 93 (1879); Kew Bull. 1893, 274; (non Ortega).

Cane River valley; Castleton grounds; Harris! Fl. Jam. 10,067, 12,075.—St. Thomas, St. Cruz, Martinique, St. Vincent, Barbados,

Plant, 12-15 inches high. Leaves 3.5-7.5 cm. l., 1.5-4 cm. br., oblong-elliptical, or ovate to ovate-lanceolate, sometimes somewhat acuminate, puberulous beneath; petiole generally 5-2.5 cm. l., uppermost often shorter. Involucres long-stalked, narrowly campanulate, glabrous; lobes truncate with a comb-like fringe. Capsule minutely puberulous. Seeds ellipsoidal, 2.5 mm. l.

13. E. nudiflora Jacq. Coll. iii. 180 (1789) & Ic. Rar. t. 479 : . shrub with jointed branches; leaves in whorls of 3 or 4, sometimes opposite; stipules gland-like; cymes terminal and axillary, dichotomous; seeds irregularly wrinkled-tubercled.— Griseb. Fl. Br. W. Ind. 52; Boiss. in DC. Prodr. xv. pt. 2, 61. E. graminea Sw. Obs. Bot. 196 (1791) (non Jacq.). E. trichotoma, foliis &c. Browne Hist. Jam. 235.

Broughton! Swartz; Bancroft! Bertero; Wilson; Liguanea Hills, Prior! March; Hope River, Eggers! Gordon Town, Clute! Windward Road, Fawcett! Berwick, Harris! Fl. Jam. 5106.—St. Vincent, Colombia.

Shrub 6-10 ft. high. Branchlets 3-2-forked. Leaves 3-5 cm. l. and

longer, ovate or ovate-oblong, or elliptical, sometimes oblanceolate, apex blunt, base rounded or blunt, lighter and sparingly puberulous beneath, especially on midrib and nerves; petiole '5-1 cm. l. Involucres 10-16 in a cyme, pedicellate, puberulous, hemispherical; lobes obovate-spathulate, fringed; glands 5, 2-lipped, green, transversely oblong, inner lip shorter than the other; appendage broader than the gland, white, crenate-dentate. Cansule glabrous long stalked 3:5 mm l. Seed 3 mm l. Capsule glabrous, long stalked, 3.5 mm. l. Seed 3 mm. l.

B. Glands of the involucre without a petaloid appendage.

14. E. heterophylla L. Sp. Pl. 453 (1753); erect or ascending annual or biennial herbaceous weed; leaves of various shapes, lower leaves alternate, uppermost opposite or whorled with a red blotch at the base; bracts also red; stipules gland-like; cymes terminal, corymbose; glands cup-shaped, solitary.—Bot. Reg. t. 765; Griseb. Fl. Br. W. Ind. 54; Boiss. in DC. Prodr. xv. pt. 2, 72; Muell. Arg. in Fl. Bras. xi. pt. 2, 695; Urb. Symb. Ant. iv. 357. Millsp. in Field Columb. Mus. Bot. ii. 64, 162. E. inermis foliis &c. Plum. Pl. Amer. (Burm.) t. 251, f. 3. Poinsettia heterophylla Klotzsch & Garcke in Monatsb. Akad. Berl. (1859) 253: Millsp. tom. cit. 304; Small Fl. S.E. U. States, 722.

Wilson; March! J. P. 698, Jenman! Hope grounds; near Brown's Town, 1000 ft.; Inverness, Clarendon, 200 ft.; near Bath; Spur Tree Hill, 2600 ft.; Harris! Watson Hill, Fawcett! Fl. Jam. 5778, 6868, 6981, 7082, 8398, 10,079, 11,692, 11,957, 12,386. Constant Spring; Port Morant; Hitchcock.—Bermuda, Bahamas, W. Indies, continental tropical and subtropical America.

Herb 1-3 ft. high. Leaves 2-14 cm. l., of various forms, elliptical, ovate, lanceolate, linear, or more or less fiddle-shaped, entire or serrate-sinuate. Involucres pedicellate, campanulate, glabrous; lobes fringed. Capsule 3-lobed, glabrous, about 4 mm. in diam. Seed black, ovate with truncate base, tubercled, tubercles often forming small crests, 2.5 mm. l.

The following forms are noted by authors, but the distinguishing marks are often seen in combination on the same plant:—

Var. cyathophora Griseb. Fl. Br. W. Ind. 54 (1859); leaves fiddle-shaped with two lobes, or elliptical, or ovate, entire.—Boiss. loc. cit. E. cyathophora Murr. in Comm. Goetting. vii. 81, t. 1 (1786); Jacq. Ic. Rar. t. 480.

Var. graminifolia Engelm. in Torr. Bot. Mex. Bound. 190 (1859); leaves all, or almost all, linear-lanceolate, usually entire and more hairy beneath.—Millsp. in Bot. Gaz. xxv. 23, with fig. (1898). E. graminifolia Michx. Fl. Bor. Am. ii. 210 (1803).

15. E. geniculata Ort. Hort. Matr. Dec. 18 (1800); plant much like E. heterophylla, but leaves all of the same shape, elliptical or oblong; uppermost leaves and the bracts with a whitish blotch; involucres subsessile, cylindrical-turbinate.—Boiss. in DC. Prodr. av. pt. 2, 72. E. prunifolia Jacq. Hort. Schoenb. iii. t. 277. E. heterophylla L. var. prunifolia Griseb. Fl. Br. W. Ind. 54 (1859). Poinsettia geniculata Klotzsch & Garcke tom. cit. 101 (1859); Small loc. cit.

Wilson; March (fide Grisebach).—Tropical continental America. Examination of a larger series of specimens may prove this plant to be, as Grisebach suggests, merely a variety of E. heterophylla.

[E. pulcherrima Willd. ex Klotzsch in Otto & Dietr. Allg. Gartens ii. 27 (1834); Boiss. in DC. Prodr. xv. pt. 2, 71; Urb. Symb. Ant. iv. 356. Poinsettia pulcherrima Grah. in Edinb. N. Phil. Journ. xx. 412 (1836); Bot. Mag. t. 3493.

Poinsettia.

This well known species is a native of Central America, and is cultivated throughout the West Indies.]

16. E. alata Hook. Ic. Pl. t. 700 (1844); shrub; stems and branches long-jointed, erect, 2-winged; leaves wanting or some-

times scale-like, opposite, at the topmost nodes.—Griseb. Fl. Br. W. Ind. 52; Boiss. in DC. Prodr. xv. pt. 2, 76. Pyretrum aphyllon Plum. Pl. Amer. (Burm.) t. 234, fig. 1. Type in Herb. Kew.

Rocky wood above Christiana, Purdie! near Troy, 2500 ft. Harris! Fl. Jam. 9098.

Plant, 1-8 ft. high, glabrous; stems woody, terete, glaucous-green; branches in whorls of three or more, more or less drooping, compressed. Involucres solitary or in clusters, terminal, and at the nodes near the ends of branches; terminal cluster of three involucres, or composed of two involucres below opposite, and of three terminal, with narrow leaf-like bracteoles; involucres glabrous, hairy inside; lobes fringed with minute teeth; glands fleshy; appendages roundish. Probably diœcious. Male flowers only known. Capsule not known.

17. E. punicea Sw. Prodr. 76 (1788) & Fl. Ind. Occ. 873; small trees; branches rather thick, leafy at the ends, leafless below and marked with the scars of the fallen leaves; leaves oblanceolate to obovate; bracts scarlet; cymes corymbose with one or several heads, subterminal or from the axils at the extreme ends of branches; glands outside the involucre, below the margin.—Jacq. Collect. iii. 179 & Ic. Pl. Rar. t. 484; Ait. Hort. Kew. ii. 143; Sm. Ic. Pict. t. 3; Bot. Reg. t. 190; Bot. Mag. t. 1961; Descourt. Fl. Ant. iii. 191, t. 194; Griseb. Fl. Br. W. Ind. 54; Boiss. in DC. Prodr. xv. pt. 2, 105; Millsp. tom. cit. 164; Urb. Symb. Ant. v. 394, obs. & 395, fig. A, B. Poinsettia punicea Klotzsch & Garcke in Monatsb. Akad. Berl. (1859) 102. Euphorbiodendron puniceum Millsp. tom. cit. 305 (1909).

Wild Physic Nut.

Shakspear! Swartz; Waters! Wilson! J.P. 1034, Liberty Hill, St. Ann, Miss Stennett! Dolphin Head, 1600 ft.; Stanmore Hill, 2200 ft.; near Malvern, 2200 ft.; Negril woods, near lighthouse, 300 ft.; Peckham woodland, Clarendon, 2500-2800 ft.; Mt. Pleasant, Stony Hill, 1100 ft.; Harris! Fl. Jam. 9267, 9962, 9985, 10,241, 10,865, 11,146.—Bahamas, Cuba.

Tree, 12-30 ft., to 9 inches in diam., abounding in acrid milky juice, much branched, glabrous. Leaves 7-15 cm. l., 2-3 cm. br., apex obtuse, sometimes acute, mucronulate, gradually narrowing to a very short petiole, when dry membranous, those nearest the corymbs sometimes more or less coloured. Bracts 2-3, 1.5-4 cm. l., elliptical to obovate. Involucre 6-7 mm. l., cylindrical-campanulate; lobes very short, triangular, subacuminate, entire; glands 4-6, campanulate, attached at the back. Styles united beyond the middle, branches entire. Capsule about 1 cm. in diam. Seeds ovate, apiculate (fide Boissier).

18. E. troyana Urb. Symb. Ant. v. 394, with fig. (1908); small trees; branches rather thick, leafy at the ends, leafless below and marked with the scars of the fallen leaves; leaves narrowly oblong to oblong-lanceolate, sometimes oblanceolate; bracts scarlet; involucres solitary at the apex of branches; glands situated outside, near the middle of the involucre, decurrent.—Euphorbiodendron troyanum Millsp. loc. cit. (1909).

Near Troy, 2000-2500 ft.; Peckham Woods, Clarendon, 2500 ft.;

Harris! Fl. Jam. 8751, 9078, 10,970.

Tree 20-30 ft. high. Leaves 4-8 cm. l., ·7-1·5 cm. br., apex rounded, mucronulate, entire, leathery. Bracts 3 to several, obovate (sometimes oblong), 1·5-3 cm. l. Involucres sessile or rarely with a pedicel (3 mm.l.), subcylindrical, 5-6 mm. l., glabrous outside; lobes 8, apiculate; glands 8, campanulate, fleshy. Style with trifid apex. Capsule (immature) 1·1-1·2 cm. l., glabrous, smooth.

[E. Peplus L. Sp. Pl. 456 (1753); an annual herb; leaves elliptical, obovate, or roundish, tapering into the petiole, alternate below the umbellate inflorescence; leaf-like bracts sessile, broadly deltoid-ovate, opposite on the branches of the umbel; involucres solitary, in the forks, or axillary, or terminal; glands on the margin, 2-horned.—Syme Eng. Bot. viii. 111. t. 1265; Fl. Dan. t. 1100; Reichb. Ic. Germ. t. 4775; Griseb. Fl. Br. W. Ind. 54; Boiss. in DC. Prodr. xv. pt. 2, 141; Millspaugh tom. cit. 67.

Port Royal Mts., McNab! March; Cinchona, 5000 ft.; Kingston; Clute! Cinchona, Harris! Fl. Jam. 8580. Blue Mt. Peak, Hitchcock. A

weed of cultivation throughout Europe and Russian Asia.

Herb, 8-15 inches high, erect, branching, glabrous. Leaves (·5-2 cm. l.) and bracts entire, glabrous. Umbel usually 3-rayed, often with one or more ray-like branches below it. Involucres cup-shaped, glabrous; lobes 5, oblong, minutely fringed; glands 4, transversely oblong, with an awl-shaped horn at each end. Styles short, each with two branches. Capsule about 2 mm. in diam., 3-cornered, with two very narrow wings along each angle, glabrous. Seeds about 1·5 mm. l., oblong, slightly 6-angled, with three or four pits on the four outer faces, and a longitudinal groove on the two inner faces, grey-coloured; caruncle yellowish.]

30. PEDILANTHUS Neck.

Shrubs with fleshy branches and milky juice. Leaves alternate, entire; leaf-like bracts opposite; stipules represented by small glands. Several male flowers and one female flower enclosed within an involucre, a "cyathium." Involucres oblique, shoe shaped; the tube fissured above and notched below at the mouth, made up of two main broad lobes, free above (the fissure) and united on the opposite side nearly to the apex (the notch), with two lateral and one median accessory lobes more or less closing the fissure, the two lateral lobes shorter and more or less united with the main lobes along their fissural margin, the fifth lobe partially united with the base of the lateral lobes or sometimes entirely free. Appendix at the base of the tube, extending above the lower end of the fissure, swollen below, 2- or 3-lobed at the apex, but in Jamaican species two lobes appear to be united almost or quite to the apex. Glands 4, two inside the lower part of the appendix, and two near the junction of the appendix and the tube. Male flowers within the involucre, numerous. Perianth none. Stamen 1, the short filament jointed with the

pedicel. Female flower solitary in the centre of the involucre. Perianth of three minute scales or wanting. Ovary sessile at the top of the pedicel, 3-celled; styles united into a long protruding column, very shortly free at the apex, the branches entire or 2-cleft. Ovules solitary in each cell. Capsule breaking up elastically from the persistent axis into three 2-valved cocci. Seeds with endosperm; caruncle wanting; cotyledons broad.

Species 31, natives of tropical America from Mexico to

northern Brazil and the West Indies.

Leaves and involucres hoary..... 1. P. Grisebachii. Leaves and involucres not hoary. Leaves obovate to oblanceolate 2. P. jamaicensis.

1. P. Grisebachii Millsp. & Britton in Field Col. Mus. Bot. ii. 361 (1913); leaves narrowly lanceolate to linear, narrowed to the base, hoary, 1-3 cm. l., 3-4 mm. br.; involucres hoary

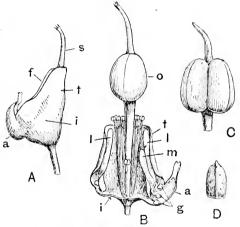

Fig. 114.—Pedilanthus.

A, Cyathium of P. jamaicensis Millsp. & Britton × 2.

B, Ditto of an older flower of same × 2; i, involucre with f, fissure; a, appendix with g, glands; t, tube of involucre; l, lateral lobe; m, median lobe; o, ovary ripening into the capsule; s, stylar column.
C, Capsule of P. Grisebachii Millsp. & Brittou × 3. D, Seed of ditto \times 3.

without, glabrous within; male pedicel glabrous, female pedicel puberulous. (Fig. 114, c, D.) Type in Herb. N. York Bot. Gard.

Long Mt. above Rock Fort, Broughton! near Bull Bay, Harris! also Britton 3677! Fl. Jam. 9645, 12,117.—Porto Rico (fide Millspaugh).

Shrubby plant, 3-6 ft. high. Leaves only on the young branches.

Cymcs terminal on the branches. Involucres 6·5-9 mm. l., scarlet; tube

truncate at the apex; main lobes broad, lateral strap-shaped, free for only about 1°3 mm. from apex, hairy along the margins, fifth lobe spathulate-strap-shaped, free about 3 mm. from apex, fringed. Appendix about 6 mm. l. Capsule minutely puberulous, about 5 mm. l. Seeds about 3°5 mm. l., ellipsoidal, apiculate.

2. P. jamaicensis Millsp. & Britton in Field Col. Mus. Bot. ii. 356 (1913); leaves obovate to oblanceolate, narrowed to the short petiole, minutely puberulous or glabrate, 3-10 cm. l.; involucres glabrous within and without, but ciliate on margins; male and female pedicels glabrous.—P. tithymaloides Poit. var. angustifolius Griseb. (Fig. 114, A, B.) Type in Herb. N. York Bot. Gard.

Swartz! Distin! Negril, woods near lighthouse, Britton and Hollick,

2067; also Harris! Fl. Jam. 10,238.

Trailing shrubby plant, with stems 10-12 ft. in length, glabrous. Cymes terminal and axillary. Involucres about 1 cm. l., scarlet; tubewall thin, the fissure open down to the appendix; notch about one-fourth the length of the tube, main lobes ovate, free part broad, rounded, lateral rectangular-oblong, about 2 mm. free at apex, median lobe about 3 mm. free, all ciliate. Appendix 6-7 mm. l., apex truncate, retuse, margin ciliate. Male flowers exserted pedicels 10-11 mm. l., filaments about 2·5 mm. l. Style branches 2-cleft.

[P. latifolius Millsp. & Britton in Ann. Miss. Bot. Gard. ii. 43 (1915); leaves ovate to ovate-orbicular, subsessile, apex acute, base roundish or subcordate, glabrous, 11.5 cm. l. or less; involucres glabrous without and within; male and female pedicels glabrous.

Near Bath, Britton, 3491. — Cuba, Hispaniola, Mona, Bermuda. Perhaps indigenous at Sanchez, S. Domingo; at all the other localities an evident escape from cultivation, or in gardens (Millsp. and Britton).

Shrubby, about 6 ft. high, young branches zig-zag, puberulent. Cymes terminal. Involucres about 2 cm. l.; main lobes lanceolate-oblong, rounded obtuse, lateral about equal, all ciliate, median lobe elongate-ligulate, truncate, ciliate, somewhat shorter than the lateral lobes and nearly closing the fissure of the tube. Appendix about one-third the length of the tube, split for half its length into two fleshy ligulate slightly grooved and emarginate lobes.]

FAMILY CALLITRICHACEÆ.

Species of Callitriche are found in Cuba and Hispaniola, and it is possible that the genus may occur in Jamaica. They are small terrestrial or aquatic plants with simple entire opposite leaves. The flowers are minute, unisexual, axillary, solitary, without sepals or petals, but generally with two bracts. The male flower consists of a single stamen; the female of a 4-celled ovary with two styles, each cell containing one pendulous ovule. The fruit is indehiscent, 4-celled, 4-seeded. The seeds are pendulous, with fleshy endosperm; embryo axile, terete.
